Download mobile apps by visiting your appropriate app store.
Available for iOS, Android and Blackberry

For pricing information please visit the website at
www.pharmpress.com/bnf

For international sales contact your local sales agent.
Contact details at www.pharmpress.com/agents

Stay up to date – sign up to the BNF
eNewsletter at www.bnf.org/newsletter
For all bulk orders of more than 10 copies: direct@macmillan.co.uk
Fax: +44 (0) 1256 302 699
Tel: +44 (0) 1256 302 699

The BNFC is available as a mobile app, online (https://bnfc.nice.org.uk/) and also through MedicinesComplete; a PDA version is also available. In addition, BNFC content can be integrated into a local formulary by using BNFC on FormularyComplete; see www.bnfc.org for details.

Distribution of printed BNFCs

In England, NICE purchases print editions of BNFC for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/about/what-we-do/evidence-services/british-national-formulary. If you are entitled to a shared copy of the BNFC, please call (0) 1268 495 609 or email: bnf@wilmingtononhealthcare.com.

In Scotland, email: nss.psd-bnf@nhs.net

In Wales, contact NHS Wales Shared Services Partnership—Contractor Services:
Tel: 01792 607420
In Northern Ireland, email: ni.bnf@hscni.net

About BNFC content

The BNFC for Children is for rapid reference by UK health professionals engaged in prescribing, dispensing, and administering medicines to children.

BNF for Children has been constructed using robust procedures for gathering, assessing and assimilating information on paediatric drug treatment, but may not always include all the information necessary for prescribing and dispensing. It is expected that the reader will be relying on appropriate professional knowledge and expertise to interpret the contents in the context of the circumstances of the individual child. BNF for Children should be used in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice. Information is also available from Medicines Information Services.

Special care is required in managing childhood conditions with unlicensed medicines or with licensed medicines for unlicensed uses. Responsibility for the appropriate use of medicines lies solely with the individual health professional.

Please refer to digital versions of BNF for Children for the most up-to-date content. BNF for Children is published in print but interim updates are issued and published in the digital versions of BNF for Children. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNF for Children’s accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to consult the material in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice.

Pharmaid

Numerous requests have been received from developing countries for BNFCs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFCs to certain Commonwealth countries. For more information on this scheme see commonwealthpharmacy.org/what-we-do/pharmaid/. If you would like to donate your copy email: admin@commonwealthpharmacy.org
BNF for Children aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information on the use of medicines for treating children.

A joint publication of the British Medical Association, the Royal Pharmaceutical Society, the Royal College of Paediatrics and Child Health, and the Neonatal and Paediatric Pharmacists Group, BNF for Children (‘BNFC’) is published under the authority of a Paediatric Formulary Committee which comprises representatives of these bodies, the Department of Health for England, and the Medicines and Healthcare products Regulatory Agency.

Many areas of paediatric practice have suffered from inadequate information on effective medicines. BNFC addresses this significant knowledge gap by providing practical information on the use of medicines in children of all ages from birth to adolescence. Information in BNFC has been validated against emerging evidence, best-practice guidelines, and crucially, advice from a network of clinical experts.

Drawing information from manufacturers’ literature where appropriate, BNFC also includes a great deal of advice that goes beyond marketing authorisations (product licences). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy; local paediatric formularies, clinical literature and national information resources have been invaluable in this process.

BNFC has been designed for rapid reference and the information presented has been carefully selected to aid decisions on prescribing, dispensing and administration of medicines. Less detail is given on areas such as malignant disease and the very specialist use of medicines generally undertaken in tertiary centres. BNFC should be interpreted in the light of professional knowledge and it should be supplemented as necessary by specialised publications. Information is also available from Medicines Information Services (see inside front cover).

It is important to use the most recent BNFC information for making clinical decisions. The print edition of BNF for Children is updated in September each year. Monthly updates are provided online via the BNF Publications website www.bnf.org, MedicinesComplete and the NHS Evidence portal. The more important changes listed under Changes p. xix are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of BNFC—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

Acknowledgements

The Paediatric Formulary Committee is grateful to individuals and organisations that have provided advice and information to the *BNF for Children* (BNFC).

The principal contributors for this update were:

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Laloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

Members of the UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable advice.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in BNFC.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNFC interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNFC has valuable access to the *Martindale* data banks by courtesy of A. Brayfield and staff.

How BNF Publications are constructed

Overview
The BNF for Children (BNFC) is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals involved in the care of children. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xiv.

BNFC is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information.

Information in BNFC has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. BNFC includes a great deal of evidence, best-practice guidelines, and advice from a network of clinical experts. BNFC is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information.

BNFC uses a variety of sources for its information; the main sources as well.

Validation of information follows a standardised process. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Paediatric Formulary Committee
The Paediatric Formulary Committee (PFC) is responsible for the content of BNFC. The PFC comprises pharmacy, medical and nursing representatives with a paediatric background, and lay representatives who have worked with children or acted as a carer of a paediatric patient; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the Department of Health for England. The PFC decides on matters of policy and reviews amendments to BNFC in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers
BNFC uses about 80 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that BNFC remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on the use of unlicensed medicines or of licensed medicines for unlicensed uses (‘off-label’ use);

- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, neonatal care, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, BNFC calls on other clinical specialists for specific developments when particular expertise is required.

BNFC also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and for assimilation into BNFC.

Editorial team
BNFC clinical writers have all worked as pharmacists or possess a pharmacy degree and further, relevant post-graduate qualification, and have a sound understanding of how drugs are used in clinical practice. A number of the clinical writers have specific experience of paediatric practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNFC content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNFC over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production.

Sources of BNFC information
BNFC uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
BNFC reviews the summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are a key source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (BNFC is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into BNFC using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager;
- changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature
Clinical writers monitor core medical, paediatric, and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a
difference between the advice in BNFC and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Paediatric Formulary Committee. BNFC enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify "triggers" for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

**Consensus guidelines**
The advice in BNFC is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to BNFC; it is therefore possible to ensure that a consistent message is disseminated. BNFC routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

**Reference sources**
Paediatric formularies and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNFC team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. BNFC has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

**Peer review**
Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Paediatric Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

**Statutory information**
BNFC routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that BNFC complies with the relevant sections of the Human Medicines Regulations 2012.

BNFC maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in BNFC as are guidelines from bodies such as the Royal College of Paediatrics and Child Health.

**Medicines and devices**
NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in BNFC.

**Comments from readers**
Readers of BNFC are invited to send in comments. Numerous letters and emails are received by the BNFC team. Such feedback helps to ensure that BNFC provides practical and clinically relevant information. Many changes in the presentation and scope of BNFC have resulted from comments sent in by users.

**Comments from industry**
Close scrutiny of BNFC by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNFC’s presentation of the role of various drugs; this is yet another check on the balance of BNFC advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

**Market research**
Market research is conducted at regular intervals to gather feedback on specific areas of development.

**Assessing the evidence**
From January 2016, recommendations made in BNFC have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNFC aims to revalidate all content over a rolling 3– to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

**Grading system**
The BNFC has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text. Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

**Levels of evidence**

- **Level 1++**
  - High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
  - Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**
  - Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
  - High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
  - Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**
  - Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
  - Non-analytic studies, e.g. case reports, case series.
Expert advice or clinical experience from respected authorities.

**Grades of recommendation**

- **Grade A: High strength**
  NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.

- **Grade B: Moderate strength**
  A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.

- **Grade C: Low strength**
  A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.

- **Grade D: Very low strength**
  Evidence level 3; or extrapolated evidence from studies rated as 2++; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.

- **Grade E: Practice point**
  Evidence level 4.
How to use BNF Publications in print

How to use the BNF for Children in print

This edition of the BNF for Children (BNFC) continues to display the fundamental change to the structure of the content that was first shown in BNFC 2015–2016. The changes were made to bring consistency and clarity to BNFC content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

— Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.

— Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 314), a drug class monograph has been created to contain the common information.

— Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.

— Section numbering – the BNFC and BNFC section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNFC and BNFC, where drugs had different therapeutic uses in children.
— Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 15.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNFC effectively, and keep up to date with significant changes in the BNFC that are relevant to their clinical practice. This How to Use the BNF for Children is key in reinforcing the details of the new structure of the BNFC to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

As with previous editions, the BNFC provides information on the use of medicines in children ranging from neonates (including preterm neonates) to adolescents. The terms infant, child, and adolescent are not used consistently in the literature; to avoid ambiguity actual ages are used in the dose statements in BNFC. The term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent in BNFC.

Structure of the BNFC

This BNFC edition continues to broadly follow the high level structure of earlier editions of the BNFC (i.e. those published before BNFC 2015–2016):

Front matter, comprising information on how to use the BNFC, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs.

Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. Asthma p. 142), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta2-agonist bronchodilators) and then alphabetically within each classification (e.g. Formoterol fumarate, Salbutamol, Salmeterol, Terbutaline sulphate).

Appendices, covering interactions, borderline substances, and cautionary and advisory labels.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers’ contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF for Children

The contents page provides the high-level layout of information within the BNFC; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types:

— an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 682),
— a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 100),
— an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 95, or Malaria, prophylaxis p. 370).

In order to select safe and effective medicines for individual children, information in the treatment summaries must be
used in conjunction with other prescribing details about the drugs and knowledge of the child’s medical and drug history.

**Monographs**

**Overview**
In earlier editions (i.e. before BNFC 2015-2016), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate was found in chapter 1, for its antitussive effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 265 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**
Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 46) or for drugs that are related to a drug class monograph (see Drug class monographs, p. xviii).

**Indication and dose**
User feedback has highlighted that one of the main uses of the BNFC is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the child should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. neonates) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

**Selecting the dose**
The dose of a drug may vary according to different indications, routes of administration, age, body-weight, and body surface area. The right dose should be selected for the right age and body-weight (or body surface area) of the child, as well as for the right indication, route of administration, and preparation.

In earlier editions of the BNFC, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a child is considered to be 11 up until the point of their 12th birthday, meaning that an age range of child 12 to 17 years is applicable to a child from the day of their 12th birthday until the day before their 18th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a child up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a child as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

A pragmatic approach should be applied to these cut-off points depending on the child’s physiological development, condition, and if weight is appropriate for the child’s age.

For some drugs (e.g. vancomycin p. 312) the neonatal dose varies according to the corrected gestational age of the neonate. Corrected gestational age is the neonate’s total age expressed in weeks from the start of the mother’s last menstrual period. For example, a 3 week old baby born at 27 weeks gestation is treated as having a corrected gestational age of 30 weeks. A term baby has a corrected gestational age of 37–42 weeks when born. For most other drugs, the dose can be based on the child’s actual date of birth irrespective of corrected gestational age. However, the degree of prematurity, the maturity of renal and hepatic function, and the clinical properties of the drug need to be considered on an individual basis.

Many children’s doses in BNFC are standardised by body-weight. To calculate the dose for a given child the weight-standardised dose is multiplied by the child’s weight (or occasionally by the child’s ideal weight for height). The calculated dose should not normally exceed the maximum recommended dose for an adult. For example, if the dose is 8 mg/kg (max. 300 mg), a child of 10 kg body-weight should receive 80 mg, but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg). Calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, the dose should be calculated from an ideal weight for height.

Occasionally, some doses in BNFC are standardised by body surface area because many physiological phenomena correlate better with body surface area. In these cases, to calculate the dose for a given child, the body surface area-standardised dose is multiplied by the child’s body surface area. The child’s body surface area can be estimated from his or her weight using the tables for Body surface area in children, see inside back cover.

Wherever possible, doses are expressed in terms of a definite frequency (e.g. if the dose is 1 mg/kg twice daily, a child of body-weight 9 kg would receive 9 mg twice daily).
Occasionally, it is necessary to include doses in the total daily dose format (e.g. 10 mg/kg daily in 3 divided doses); in these cases the total daily dose should be divided into individual doses (in this example a child of body-weight 9 kg would receive 30 mg 3 times daily).

Most drugs can be administered at slightly irregular intervals during the day. Some drugs, e.g. antimicrobials, are best given at regular intervals. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night–time dose may be given at the child's bedtime.

Special care should be taken when converting doses from one metric unit to another, and when calculating infusion rates or the volume of a preparation to administer. Where possible, doses should be rounded to facilitate administration of suitable volumes of liquid preparations, or an appropriate strength of tablet or capsule.

**Other information relevant to indication and dose**

The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNFC includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNFC recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

**Minimising harm and drug safety**

The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a child who has constipation, it may be preferable to avoid a drug that frequently causes constipation.

Clinically relevant Side-effects for drugs are included in the monographs or drug class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNFC also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions, when the information is included under Allergy and cross sensitivity.

The Important safety advice section in the BNFC, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

**Use of drugs in specific patient populations**

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 16, and Prescribing in renal impairment p. 16. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. fluconazole p. 358).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 18 and Prescribing in breast-feeding p. 18. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma p. 142).

Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 358).

A new section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 727) has been included.

**Administration and monitoring**

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir p. 397). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 268) and further details, such as masking the bitter taste of some medicines.

Whenever possible, intramuscular injections should be avoided in children because they are painful.
After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 162). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 547), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 99); these are covered under Treatment cessation.

Choice and supply
The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (see Taking Medicines to Best Effect). Taking the time to explain to the child (and the child’s carer if appropriate) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 338, or recognising signs of blood, liver, or skin disorders with carbamazepine p. 189); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products are not interchangeable e.g. modified-release theophylline p. 162), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 117), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 47).

Medicinal forms
In the BNFC, preparations follow immediately after the monograph for the drug that is their main ingredient. In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 34).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Form" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNFC, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in earlier BNFC versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Children should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

Earlier editions of the BNFC only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1016. These labels have now been applied at the level of the dose form.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

Prices in the BNFC
Basic NHS net prices are given in the BNFC to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect wholesale dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNFC as prices vary between different manufacturers.

BNFC prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.
Typical layout of a monograph and associated medicinal forms

1 Class Monographs and drug monographs
In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle.

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2 Drug classifications
Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3 Review date
The date of last review of the content

4 Specific preparation name
If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

5 Evidence grading
Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A B C D E are displayed next to the recommendations within the text, and are preceded by the symbol: ▶

For further information, see How BNF Publications are constructed

---

Class monograph

CLASSIFICATION

Drug monograph

1

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

- **INDICATIONS AND DOSE** Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

  - **Indication**
    - **ROUTE**
    - **Age groups:** [Neonate/Child]
    - Dose and frequency of administration (max. dose)

- **SPECIFIC PREPARATION NAME**

  - **Indication**
    - **ROUTE**
    - **Age groups:** [Neonate/Child]
    - Dose and frequency of administration (max. dose)

- **DOSE EQUIVALENCE AND CONVERSION** information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

- **PHARMACOKINETICS** how the body affects a drug (absorption, distribution, metabolism, and excretion)

- **POTENCY** a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **DOSES AT EXTREMES OF BODY-WEIGHT** dosing information for patients who are overweight or underweight

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

- **IMPORTANT SAFETY INFORMATION** Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided

- **CAUTIONS** details of precautions required

- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1

- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically

- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions

- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

- **PREGNANCY** advice on the use of a drug during pregnancy

- **BREAST FEEDING** advice on the use of a drug during breast feeding
● **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment

● **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment

● **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug

● **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index

● **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests

● **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn

● **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration

● **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary

● **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions

● **PARENT AND CARER ADVICE** for drugs with a special need for counselling

● **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS

● **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals and SMC advice

● **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Paediatric Formulary Committee to be less suitable for prescribing

● **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

---

**MEDICINAL FORMS**

**Form**

- **CAUTIONARY AND ADVISORY LABELS** if applicable
- **EXCIPIENTS** clinically important but not comprehensive [consult manufacturer information for full details]
- **ELECTROLYTES** if clinically significant quantities occur

- **Preparation name** (Manufacturer/Non-proprietary)

- **Drug name and strength pack sizes** [Pom] Prices

**Combinations available** this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation
Drug class monographs
In earlier editions of the BNFC, information relating to a class of drug sharing the same properties (e.g. tetracyclines p. 337), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. beta-adrenoceptor blockers (systemic) p. 100). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol tartrate p. 103). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 78).

Evidence grading
The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. ix). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

Other content

Nutrition
Appendix 2 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Other useful information

Finding significant changes in the BNFC

- **Changes**, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNFC, as well as a list of preparations that have been discontinued and removed from the BNFC. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNFC, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently;

- **Changes to the Dental Practitioners’ Formulary**, are located at the end of the Dental List;

- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

Using other sources for medicines information
The BNFC is designed as a digest for rapid reference. Less detail is given on areas such as malignant disease and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. The BNFC should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.
Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**

Significant changes that appear in the print edition of *BNF for Children* 2017–2018:

- Acetylcysteine p. 814 for paracetamol overdose [MHRA advice]
- Anal fissure p. 67: new guidance on management.
- Antibacterials, principles of therapy p. 287: new guidance on early management of sepsis.
- Cholestasis p. 62: updated guidance on management.
- Coeliac disease p. 33: new guidance on management.
- Constipation p. 38: updated guidance on management.
- Contraceptive, interactions p. 474: updated guidance.
- Diabetes p. 424: updated guidance on management.
- Epilepsy p. 184: updated guidance on epilepsy and driving.
- Etonogestrel p. 489 (Nexplanon®) contraceptive implants: reports of device in vasculature and lung [MHRA/CHM advice].
- Exocrine pancreatic insufficiency p. 69: updated guidance on management.
- Food allergy p. 59: updated guidance on management.
- Haemorrhoids p. 67: new guidance on management.
- Hyoscine butylbromide (Buscopan®) injection p. 61: risk of serious adverse effects in patients with underlying cardiac disease [MHRA/CHM advice].
- Hypoglycaemia p. 443: updated guidance on sources of oral glucose.
- Imatinib p. 532: risk of hepatitis B reactivation [MHRA/CHM advice].
- Inborn errors of primary bile acid synthesis p. 63: updated guidance on management.
- Irritable bowel syndrome p. 33: updated guidance on management.
- Lumacaftor with ivacaftor p. 179 for treating cystic fibrosis homozygous for F508del mutation [NICE guidance].
- Nocturnal enuresis in children p. 467: updated guidance on management.
- Paraffin-based skin emollients on dressings or clothing p. 683: fire risk [MHRA/CHM advice].
- Pegaspargase p. 526 for treating acute lymphoblastic leukaemia [NICE guidance].
- Primary biliary cholangitis p. 63: updated guidance on management.
- Risk of severe harm and death due to withdrawing insulin from pen devices [NHS Improvement Patient Safety Alert], see Insulins p. 432.
- Risk of death and severe harm from error with injectable phenytoin [NHS Improvement Patient Safety Alert], see phenytoin p. 198.
- Short bowel syndrome p. 34: new guidance on management.
- Sodium valproate p. 200: resources to support the safety of girls and women who are being treated with valproate [NHS improvement patient safety alert].
- Tuberculosis p. 345 updated guidance on management.
- Ulcerative colitis p. 25: updated guidance on management.
- Urinary retention p. 469: updated guidance on management.
- Valproic acid p. 205: resources to support the safety of girls and women who are being treated with valproate [NHS improvement patient safety alert].
- Warfarin sodium p. 94: reports of calciphylaxis [MHRA/CHM advice].

**Dose changes**

Changes in dose statements that appear in the print edition of *BNF for Children* 2017–2018:

- Etoricoxib p. 624 [rheumatoid arthritis and ankylosing spondylitis].
- Fenofibrate p. 127 [dose in renal impairment].
- Nystatin p. 680

**Classification changes**

Classification changes that appear in the print edition of *BNF for Children* 2017–2018:

**New names**

Name changes that appear in the print edition of *BNF for Children* 2017–2018:

- Ketek®

**New preparations**

Preparations discontinued in the print edition of *BNF for Children* 2017–2018:

- Benepali® [etanercept p. 616].
- BriiViat® [brivaracetam p. 188].
- Ciloidex® [dexamethasone with ciprofloxacin p. 663].
- Delmosart® [methylphenidate hydrochloride p. 218].
- Descovy® [emtricitabine with tenofovir alafenamide p. 400].
- Edurant® [rilpivirine p. 396].
- Exiade® [deferasirox p. 548].
- Genvoya® [elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 399].
- Odefsey® [emtricitabine with rilpivirine and tenofovir alafenamide p. 400].
- Oncaspar® [pegaspargase p. 526].
- Orkambi® [lumacaftor with ivacaftor p. 179].
- Monuril® [fosfomycin p. 340].
- Repatha® [evolocumab p. 131].
- Revestive® [teduglutide p. 35].
- Revolade® [etromobopag p. 554].
- Raxone® [idebenone p. 659].
- Spectrila® [asparaginase p. 523].
- Stialanar® [glycopyrronium bromide p. 780].
- Translarna® [ataluren p. 618].
- Vantobra® [nebuliser solution [tobramycin p. 300].
- Vimizim® [elosulfate alfa p. 582].
- Votubia® [dispersible tablets [everolimus p. 531].
**Guidance on prescribing**

**General guidance**
Medicines should be given to children only when they are necessary, and in all cases the potential benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered.

It is important to discuss treatment options carefully with the child and the child’s carer. In particular, the child and the child’s carer should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, this should be highlighted.

**Prescribing competency framework**
The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals be safe and effective prescribers with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

**Taking medicines to best effect**
Difficulties in adherence to drug treatment occur regardless of age. Factors that contribute to poor compliance with prescribed medicines include:

- difficulty in taking the medicine (e.g. inability to swallow the medicine);
- unattractive formulation (e.g. unpleasant taste);
- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- carers’ or child’s perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear.

The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs of the child’s family that can affect acceptance of medicines.

Taking the time to explain to the child (and carers) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team can be important. Giving advice on the management of adverse effects and the possibility of alternative treatments may encourage carers and children to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

**Drug treatment in children**
Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care; the risk of toxicity is increased by a reduced rate of drug clearance and differing target organ sensitivity. The terms infant, child and adolescent are used inconsistently in the literature. However, for reference purposes only, the terms generally used to describe the paediatric stages of development are:

- **Preterm neonate**: Born at < 37 weeks gestation
- **Term neonate**: Born at 37 to 42 weeks gestation
- **Post-term neonate**: Born at ≥ 42 weeks gestation
- **Neonate**: From 0 up to 28 days of age (or first 4 weeks of life)
- **Infant**: From 28 days up to 24 months of age
- **Child**: From 2 years up to 12 years of age
- **Adolescent**: From 12 years up to 18 years of age

In BNF for Children, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

**Administration of medicines to children**
Children should be involved in decisions about taking medicines and encouraged to take responsibility for using them correctly. The degree of such involvement will depend on the child’s age, understanding, and personal circumstances.

Occasionally a medicine or its taste has to be disguised or masked with small quantities of food. However, unless specifically permitted (e.g. some formulations of pancreatin p. 70), a medicine should not be mixed with large quantities of food because the full dose might not be taken and the child might develop an aversion to food if the medicine imparts an unpleasant taste. Medicines should not be mixed or administered in a baby’s feeding bottle.

Children under 5 years (and some older children) find a liquid formulation more acceptable than tablets or capsules. However, for long-term treatment it may be possible for a child to be taught to take tablets or capsules.

An oral syringe should be used for accurate measurement and controlled administration of an oral liquid medicine. The unpleasant taste of an oral liquid can be disguised by flavouring it or by giving a favourite food or drink immediately afterwards, but the potential for food-drug interactions should be considered.

Advice should be given on dental hygiene to those receiving medicines containing xerogenic sugars for long-term treatment; sugar-free medicines should be provided whenever possible.

Children with nasal feeding tubes in place for prolonged periods should be encouraged to take medicines by mouth if possible; enteric feeding should generally be interrupted before the medicine is given (particularly if enteral feeds reduce the absorption of a particular drug). Oral liquids can be given through the tube provided that precautions are taken to guard against blockage; the dose should be washed down with warm water. When a medicine is given through a nasogastric tube to a neonate, sterile water must be used to accompany the medicine or to wash it down.

The intravenous route is generally chosen when a medicine cannot be given by mouth; reliable access, often a central venous line, should be used for children whose treatment involves irritant or inotropic drugs or who need to receive the medicine over a long period or for home therapy. The subcutaneous route is used most commonly for insulin...
administration. Intramuscular injections should preferably be avoided in children, particularly neonates, infants, and young children. However, the intramuscular route may be advantageous for administration of single doses of medicines when intravenous cannulation would be more problematic or painful to the child. Certain drugs, e.g. some vaccines, are only administered intramuscularly.

The intrathecal, epidural and intraosseous routes should be used only by staff specially trained to administer medicines by these routes. Local protocols for the management of intrathecal injections must be in place.

Managing medicines in school
Administration of a medicine during schooltime should be avoided if possible; medicines should be prescribed for once or twice-daily administration whenever practicable. If the medicine needs to be taken in school, this should be discussed with parents or carers and the necessary arrangements made in advance; where appropriate, involvement of a school nurse should be sought. Managing Medicines in Schools and Early Years Settings produced by the Department of Health provides guidance on using medicines in schools (www.dh.gov.uk).

Patient information leaflets
Manufacturers’ patient information leaflets that accompany a medicine, cover only the licensed use of the medicine. Therefore, when a medicine is used outside its licence, it may be appropriate to advise the child and the child’s parent or carer that some of the information in the leaflet might not apply to the child’s treatment. Where necessary, inappropriate advice in the patient information leaflet should be identified and reassurance provided about the correct use in the context of the child’s condition.

Biological medicines
Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

Biosimilar medicines
A biosimilar medicine is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence Biological medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

Prescribing and dispensing
The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

Safety monitoring
Biosimilar medicines are subject to a black triangle status at the time of initial authorisation. It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These ‘in-use product safety assessment reports’ will be published for new biosimilar medicines as they become available, see www.ukmi.nhs.uk/activities/patientSafety/default.asp?pageRef=20.

National funding/access decisions
The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see Evidence summary: new medicines, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

National information

In Northern Ireland, see niformulary.hscni.net/ManagedEntry/bios/Pages/default.aspx.

In Scotland, see www.scottishmedicines.org.uk/About_SMCS/Policy_statements/Biosimilar_Medicines.

In Wales, see www.wales.nhs.uk/sites3/Documents/814/BIOSIMILARS-ABUNpositionStatement%5BNov2015%5D.pdf.

Availability
The following drugs are available as a biosimilar medicine:

- Epoetin alfa p. 537
- Epoetin zeta p. 539
- Etanercept p. 616
- Filgrastim p. 551
- Infliximab p. 31
- Insulin glargine p. 435
- Somatropin p. 454

Complementary and alternative medicine
An increasing amount of information on complementary and alternative medicine is becoming available. Where appropriate, the child and the child’s carers should be asked about the use of their medicines, including dietary supplements and topical products. The scope of BNF for Children is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

BNF for Children and marketing authorisation
Where appropriate the doses, indications, cautions, contraindications, and side-effects in BNF for Children reflect those in the manufacturers’ Summaries of Product Characteristics
(SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). BNF for Children does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, BNF for Children reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisation. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

As far as possible, medicines should be prescribed within the terms of the marketing authorisation. However, many children require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 do not prohibit the use of unlicensed medicines.

BNF for Children includes advice involving the use of unlicensed medicines or of licensed medicines for unlicensed uses (‘off-label’ use). Such advice reflects careful consideration of differences available to manage a given condition and the weight of evidence and experience of the unlicensed intervention. Where the advice falls outside a drug’s marketing authorisation, BNF for Children shows the licensing status in the drug monograph. However, limitations of the marketing authorisation should not preclude unlicensed use where clinically appropriate.

Prescribing unlicensed medicines Prescribing unlicensed medicines or medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

Drugs and skilled tasks

Prescribers and other healthcare professionals should advise children and their carers if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and attempts to drive in excess of speciﬁed limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Oral syringes

An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-mL spoon is used for doses of 5 mL (or multiples thereof).

Excipients

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in BNF for Children. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since they do not cause dental caries. Children receiving medicines containing cariogenic sugars, or their carers, should be advised of dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible, particularly if treatment is required for a long period.

Where information on the presence of alcohol, aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in BNF for Children against the relevant preparation. Information is provided on selected excipients in skin preparations, in vaccines, and on selected preservatives and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in BNF for Children. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in BNF for Children; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with metronidazole p. 319.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant children. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in BNF for Children and in the product literature (available at www.medicines.org.uk/emc/), contact the manufacturer if it is essential to check details.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Care is required to avoid sources of heat (including hair dryers) when flammable substances are used on the skin or hair. Substances, such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution; contact with the skin and inhalation of dust should be avoided. Healthcare professionals and carers should guard against exposure to sensitising, toxic or irritant substances if it is necessary to crush tablets or open capsules.
EEA and Swiss prescriptions
Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions
The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:
- not be left unattended at reception desks;
- not be left in a car where they may be visible;
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)
In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific child. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit the child’s care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group
Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in BNF for Children when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.
Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements
Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement (). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg /m² where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL). The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not 0.5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- 'Micrograms' and 'nanograms' should not be abbreviated. Similarly 'units' should not be abbreviated.
- The term 'millilitre' (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10 mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
  - The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only;

avoid creating generic titles for modified-release preparations).
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used.

Sample prescription

Abbreviation of titles In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary (‘generic’) titles are given, they should be used for prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the child should always receive the same brand; in such cases, the brand name or the manufacturer should be stated.

Non-proprietary names of compound preparations Non-proprietary names of compound preparations which
appear in *BNF for Children* are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients. Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted. Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained. Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different duration of action.
Supply of medicines

Overview
When supplying a medicine for a child, the pharmacist should ensure that the child and the child’s carer understand the nature and identity of the medicine and how it should be used. The child and the carer should be provided with appropriate information (e.g. how long the medicine should be taken for and what to do if a dose is missed or the child vomits soon after the dose is given).

Safety in the home
Carers and relatives of children must be warned to keep all medicines out of the reach and sight of children. Tablets, capsules and oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the child’s carer will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a pharmacy for destruction.

Labelling of prescribed medicines
There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Unlicensed medicines
A drug or formulation that is not covered by a marketing authorisation may be obtained from a pharmaceutical company, imported by a specialist importer, manufactured by a commercial or hospital licensed manufacturing unit, or prepared extemporaneously against a prescription. The safeguards that apply to products with marketing authorisation should be extended, as far as possible, to the use of unlicensed medicines. The safety, efficacy, and quality (including labelling) of unlicensed medicines should be assured by means of clear policies on their prescribing, purchase, supply, and administration. Extra care is required with unlicensed medicines because less information may be available on the drug and any formulation of the drug. The following should be agreed with the supplier when ordering an unlicensed or extemporaneously prepared medicine:

- the specification of the formulation;
- documentation confirming the specification and quality of the product supplied (e.g. a certificate of conformity or of analysis);
- for imported preparations product and licensing information should be supplied in English.

Extemporaneous preparations
A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. Every effort should be made to ensure that an extemporaneously prepared product is stable and that it delivers the requisite dose reliably; the child should be provided with a consistent formulation regardless of where the medicine is supplied to minimise variations in quality. Where there is doubt about the formulation, advice should be sought from a medicines information centre, the pharmacy at a children’s hospital, a hospital production unit, a hospital quality control department, or the manufacturer.

In many cases it is preferable to give a licensed product by an unlicensed route (e.g. an injection solution given by mouth) than to prepare a special formulation. When tablets or capsules are cut, dispersed, or used for preparing liquids immediately before administration, it is important to confirm uniform dispersal of the active ingredient, especially if only a portion of the solid content (e.g. a tablet segment) is used or if only an aliquot of the liquid is to be administered. In some cases the child’s clinical condition may require a dose to be administered in the absence of full information on the method of administration. It is important to ensure that the appropriate supporting information is available at the earliest opportunity.

Preparation of products that produce harmful dust (e.g. cytotoxic drugs, hormones, or potentially sensitising drugs such as neomycin sulfate p. 692) should be avoided or undertaken with appropriate precautions to protect staff and carers.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.
Emergency supply of medicines

Emergency supply requested by member of the public
Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;

b) that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital p. 208, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made by the pharmacist in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;
   iv) the nature of the emergency;

d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words ‘Emergency supply’;
   vi) the words ‘Keep out of the reach of children’ (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 208 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber
Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

b) that the prescriber has undertaken to furnish a prescription within 72 hours;

c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 208 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines
1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, London Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 788, cocaine, diamorphine hydrochloride (heroin) p. 267, dipipanone hydrochloride, lysergide (LSD), methadone hydrochloride p. 286, methylenedioxymethamphetamine (MDMA, 'ecstasy'), morphine, opium, pethidine hydrochloride p. 276, phencyclidine, remifentanil p. 789, and class B substances when prepared for injection.

- **Class B** includes: oral amfetamines, barbiturates, cannabis, cannabis resin, codeine phosphate p. 265, ethylmorphine, glutethimide, ketamine p. 790, nabilone p. 251, pentazocine, phentemazine, and pholcodine p. 181.

- **Class C** includes: certain drugs related to the amfetamines such as benzafetidine and chlorpropamide p. 263, mazindol, meprobamate, penoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 276, zaleplon, zolpidem tartrate, zopiclone, androgenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatropin, somatrem, and somatropin p. 454.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs such as lysergide which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

- **Schedule 2** includes drugs such as diamorphine hydrochloride (heroin) p. 267, morphine p. 271, nabilone p. 251, remifentanil p. 789, pethidine hydrochloride p. 276, seconobarbital, glutethimide, the amfetamines, sodium oxybate and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 263, mazindol, meprobamate, midazolam p. 215, pentazocine, phentermine, temazepam p. 790, and tramadol hydrochloride p. 276. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate, midazolam, pentazocine, phentermine, tramadol hydrochloride, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

- **Schedule 4** includes in Part I benzodiazepines (except temazepam p. 790 and midazolam p. 215, which are in Schedule 3), zaleplon, zolpidem tartrate, and zopiclone which are subject to minimal control. Part II includes androgenic anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatotropin, somatrem, and somatropin p. 454. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

**Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions

Preparations in Schedules 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout BNF for children using the following symbols:

<table>
<thead>
<tr>
<th>Schedule</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>C4-2</td>
<td>for preparations in Schedule 4 (Part II)</td>
</tr>
<tr>
<td>C5</td>
<td>for preparations in Schedule 5</td>
</tr>
</tbody>
</table>

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible and must be signed by the prescriber, be dated, and specify the prescriber’s address. A machine-written prescription is acceptable, but the prescriber’s signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to prescription requirements must always state:

- the name and address of the patient;
- in the case of a preparation, the form (The dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available) and where appropriate the strength (when more than one strength of a preparation exists the strength required must be specified) of the preparation;
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not);
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for N. Ireland not confirmed). Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and delay in supplying the necessary medicine. A prescription for a Controlled Drug
in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription).

**Instalments and ‘repeats’**

A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified (A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 263, and diazepam p. 212 may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H (MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/. Prescriptions ordering ‘repeats’ on the same form are not permitted for Controlled Drugs in Schedules 2 or 3.

**Private prescriptions**

Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

**Department of Health guidance**

 Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.gov.uk/dh.

**Dependence and misuse**

The most serious drugs of addiction are cocaine, diamorphine hydrochloride (heroin) p. 267, morphine p. 271, and the synthetic opioids. Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amphetamine and related compounds is widespread. Benzodiazepines are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability. Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. Lyserygide (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening. There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 790 and gamma-hydroxybutyrate (sodium oxybate, GHB).

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are
less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.

- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if dependence is suspected.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- the quantity should be shown in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk (in cases of emergency, telephone (020) 7035 6330).

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, London. SW1P 4DF. Alternatively, completed application forms can be emailed to discosfromofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application. Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

**Notification of drug misusers**

Doctors should report cases of drug misuse to their regional or national drug misuse database or centre.

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.na.nhs.uk/ndtms.aspx. Enquiries about NDTMS, and how to submit data, should initially be directed to: EvidenceApplicationTeam@phe.gov.uk

In **Scotland**, doctors should report cases to the Sub stance Misuse Programme (SMP).

Tel: (0131) 275 6348

In **Northern Ireland**, the Misuse of Drugs (Notification of Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:

Dr Ian McMaster, C3 Castle Buildings, Belfast, BT4 3FQ
Tel: (028) 9052 2421, Fax: (028) 9052 0718
ian.mcmaster@dhpssni.gov.uk

Administrative contact:

Public Health Information & Research Branch
Department of Health
Annexe 2, Castle Buildings, Stormont, Belfast, BT4 3SQ
Tel: 028 9052 2504

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDM) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement. In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.
Adverse reactions to drugs

Yellow card scheme
Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of BNF for Children. Send Yellow Cards to:
FREETEL YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine. Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:
- serious, medically significant or result in harm. Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card. The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:
- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme. Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages. The following Yellow Card Centres can be contacted for further information:

MHRA Drug Safety Update

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

Self-reporting
Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring
In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

Newer drugs and vaccines
Only limited information is available from clinical trials on the safety of new medicines. Further understanding about
the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

**Medication errors**
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

**Adverse reactions to medical devices**
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

**Side-effects in the BNF for Children**
The BNF for Children includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF for Children.

**Special problems**

**Symptoms**
Children may be poor at expressing the symptoms of an adverse drug reaction and parental opinion may be required.

**Delayed drug effects**
Some reactions (e.g. cancers and effects on development) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**Congenital abnormalities**
When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

**Prevention of adverse reactions**
Adverse reactions may be prevented as follows:
- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the child has had previous reactions to the drug or formulation;
- prescribe as few drugs as possible and give very clear instructions to the child, parent, or carer;
- whenever possible use a familiar drug; with a new drug be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- obtain a full drug history including asking if the child is already taking other drugs including over-the-counter medicines; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, particularly in neonates, which can affect the potential for adverse effects. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effects of the drug;
- warn the child, parent, or carer if serious adverse reactions are liable to occur.

**Drug allergy (suspected or confirmed)**
Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:
- The reaction occurred while the child was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The child has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present. The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy: **Immediate, rapidly-evolving reactions** (onset usually less than 1 hour after drug exposure)
- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 165
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

**Non-immediate reactions, without systemic involvement** (onset usually 6–10 days after first drug exposure or 3 days after second exposure)
- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

**Non-immediate reactions, with systemic involvement** (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)
- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythoderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

**Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Children and parents or carers should be given information about which drugs and drug-classes to avoid and encouraged to share the drug allergy status.**

**If a drug allergy is suspected, consider stopping the**
suspected drug and advising the child and parent or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Children presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Children presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Children presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient children). For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Defective medicines
During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification.
The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:
The Defective Medicines Report Centre
Medicines and Healthcare products Regulatory Agency,
151 Buckingham Palace Road, London, SW1W 9SZ

Guidance on intravenous infusions

Intravenous infusions for neonatal intensive care

Intravenous policy A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards. The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion syringe should be labelled with the neonate’s name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
- Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of microorganisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or may occur with loss of potency, increase in toxicity, or other adverse effect. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed. A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

Blood Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsion These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® might be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Method

Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5). When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. Potassium chloride is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the
formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service. Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. sodium nitroprusside.

**Prescribing in hepatic impairment**

**Overview**

Children have a large reserve of hepatic metabolic capacity and modification of the choice and dosage of drugs is usually unnecessary even in apparently severe liver disease. However, special consideration is required in the following situations:

- liver failure characterised by severe derangement of liver enzymes and profound jaundice; the use of sedative drugs, opioids, and drugs such as diuretics and amphotericin p. 357 which produce hypokalaemia may precipitate hepatic encephalopathy;
- impaired coagulation, which can affect response to oral anticoagulants;
- in cholestatic jaundice elimination may be impaired of drugs such as fusidic acid p. 342 and rifampicin p. 349 which are excreted in the bile;
- in neonates, particularly preterm neonates, and also in infants metabolic pathways may differ from older children and adults because liver enzyme pathways may be immature.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in *BNF for Children*.

**Prescribing in renal impairment**

**Issues encountered in renal impairment**

The use of drugs in children with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may produce toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by children with renal impairment;
- some drugs are not effective when renal function is reduced;
- neonates, particularly preterm, may have immature renal function.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

**Principles of dose adjustment in renal impairment**

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity. For many drugs with only minor or no dose-related side-effects, very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin dose regimens based on glomerular filtration rate should be used.

When both efficacy and toxicity are closely related to plasma–drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma–drug concentration.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentration. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment, it can take many doses at the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same as the initial dose for a child with normal renal function.

**Nephrotoxic drugs** should, if possible, be avoided in children with renal disease because the consequences of nephrotoxicity are likely to be more serious when the renal reserve is already reduced.

Glomerular filtration rate is low at birth and increases rapidly during the first 6 months. Thereafter, glomerular filtration rate increases gradually to reach adult levels by 1–2 years of age, when standardised to a typical adult body surface area (1.73 m²). In the first weeks after birth, serum creatinine falls; a single measure of serum creatinine provides only a

**Drugs given by continuous intravenous infusion to neonates**

The information provided in *BNF for Children* covers dilution with Glucose intravenous infusion 5% and 10% and Sodium chloride intravenous infusion 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided, therefore care should be taken if water for injections is used.
crude estimate of renal function and observing the change over days is of more use. In the neonate, a sustained rise in serum creatinine or a lack of the expected postnatal decline, is indicative of a reduced glomerular filtration rate. Dose recommendations are based on the severity of renal impairment. This is expressed in terms of **glomerular filtration rate** (mL/minute/1.73 m²).

The following equations provide a guide to glomerular filtration rate.

**Child over 1 year:**
Estimated glomerular filtration rate (mL/minute/1.73 m²) = \(40 \times \frac{\text{height (cm)}}{\text{serum creatinine (micromol/litre)}}\)

**Neonate:**
Estimated glomerular filtration rate (mL/minute/1.73 m²) = \(30 \times \frac{\text{height (cm)}}{\text{serum creatinine (micromol/litre)}}\)

The values used in these formulas may differ according to locality or laboratory. The serum-creatinine concentration is sometimes used as a measure of renal function but is only a **rough guide** even when corrected for age, weight, and sex.

**Important** The information on dose adjustment in *BNF for Children* is expressed in terms of estimated glomerular filtration rate. Renal function in adults is increasingly being reported as estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m²; however, eGFR is derived from the MDRD (Modification of Diet in Renal Disease) formula which is not validated for use in children. eGFR derived from the MDRD formula should **not** be used to adjust drug doses in children with renal impairment.

In *BNF for Children*, values for measures of renal function are included where possible. However, where such values are not available, the *BNF for Children* reflects the terms used in the published information.

**Degrees of renal impairment defined using estimated glomerular filtration rate (eGFR)**

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR(^2) mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal: Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild: Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate(^2): Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe: Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure: Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

1. Estimated glomerular filtration rate (eGFR) derived from the Modification of Diet in Renal Disease (MDRD) formula for use in patients over 18 years
2. NICE clinical guideline 73 (September 2008)-Chronic kidney disease: Stage 3A eGFR = 45–59, Stage 3B eGFR = 30–44

Drug prescribing should be kept to the minimum in all children with severe renal disease. If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in *BNF for Children*.

**Dialysis**
For prescribing in children on renal replacement therapy consult specialist literature.
Prescribing in pregnancy

Overview
Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development. The BNF and BNF for Children identify drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for Children.

Important
Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service www.uktis.org. Tel: 0344 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Overview
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds. Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Most medicines given to a mother cause no harm to breast-fed infants and there are few contra-indications to breast-feeding when maternal medicines are necessary. However, administration of some drugs to nursing mothers can harm the infant. In the first week of life, some such as preterm or jaundiced infants are at a slightly higher risk of toxicity.

Toxicity to the infant can occur if the drug enters the milk in pharmacologically significant quantities. The concentration in milk of some drugs (e.g. fluvastatin p. 129) may exceed the concentration in maternal plasma so that therapeutic doses in the mother can cause toxicity to the infant. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 208) while others can affect lactation (e.g. bromocriptine). Drugs in breast milk may, at least theoretically, cause hypersensitivity in the infant even when concentration is too low for a pharmacological effect. BNF for Children identifies drugs:

- which should be used with caution or which are contra-indicated in breast-feeding for the reasons given above;
- which, on present evidence, may be given to the mother during breast-feeding, because they appear in milk in amounts which are too small to be harmful to the infant;
- which are not known to be harmful to the infant although they are present in milk in significant amounts.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF for Children.

Important
For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Overview

Palliative care is the active and total approach to the care of children and young adults with life-limiting and life-threatening conditions, embracing physical, emotional, social, and spiritual elements of their care. It focuses on enhancing the quality of life for the child and support for their family, and includes the management of distressing symptoms, provision of respite, and care following death and bereavement.

Effective palliative care requires a broad multidisciplinary approach that includes the whole family, and ideally should start as soon as possible after diagnosis or recognition of a life-threatening condition.

Drug treatment

The number of drugs should be as few as possible. Oral medication is usually appropriate unless there is severe nausea or vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

For further information on the use of medicines in paediatric palliative care, see the Association for Paediatric Palliative Medicine (APPM) Master Formulary available at www.appm.org.uk/10.html.

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 260, NSAID), opioid (e.g. codeine phosphate p. 265 ‘weak’, morphine p. 271 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain.

Codeine phosphate or tramadol hydrochloride p. 276 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine, transdermal fentanyl p. 268, hydromorphone hydrochloride p. 271, methadone hydrochloride p. 286, or oxycodone hydrochloride p. 273, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases

In addition to the above approach, radiotherapy and bisphosphonates may be useful for pain due to bone metastases.

Neuropathic pain

Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant, most commonly amitriptyline hydrochloride p. 229, for several weeks. An antiepileptic such as carbamazepine p. 189, may be added or substituted if pain persists. Ketamine p. 790 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 419, which reduces oedema around the tumour, thus reducing compression. Nerve blocks can be considered when pain is localised to a specific area.

Transcutaneous electrical nerve stimulation (TENS) may also help.
Equivalent doses of opioid analgesics.

This table is only an approximate guide (doses may not correspond with those given in clinical practice); children should be carefully monitored after any change in medication and dose titration may be required.

<table>
<thead>
<tr>
<th>Analgesic/Route</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Codeine: PO</td>
<td>100 mg</td>
</tr>
<tr>
<td>Diamorphine: IM, IV, SC</td>
<td>3 mg</td>
</tr>
<tr>
<td>Dihydrocodeine: PO</td>
<td>100 mg</td>
</tr>
<tr>
<td>Hydromorphone: PO</td>
<td>2 mg</td>
</tr>
<tr>
<td>Morphine: PO</td>
<td>10 mg</td>
</tr>
<tr>
<td>Morphine: IM, IV, SC</td>
<td>5 mg</td>
</tr>
<tr>
<td>Oxycodone: PO</td>
<td>6.6 mg</td>
</tr>
<tr>
<td>Tramadol: PO</td>
<td>100 mg</td>
</tr>
</tbody>
</table>

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

Parenteral route Diamorphine hydrochloride p. 267 is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose is approximately a third of the oral dose of morphine p. 271. Subcutaneous infusion of diamorphine hydrochloride via a continuous infusion device can be useful (for details, see Continuous Subcutaneous Infusions). If the child can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine hydrochloride. See the table Equivalent doses of Morphine and Diamorphine p. 23.

Rectal route Morphine p. 271 is also available for rectal administration as suppositories.

Transdermal route Transdermal preparations of fentanyl p. 268 and buprenorphine p. 263 [not licensed for use in children] are available; they are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under fentanyl p. 268) because inappropriate use has caused fatalities. The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

<table>
<thead>
<tr>
<th>Morphine</th>
<th>Buprenorphine</th>
</tr>
</thead>
<tbody>
<tr>
<td>30 mg daily</td>
<td>‘12’ patch</td>
</tr>
<tr>
<td>60 mg daily</td>
<td>‘25’ patch</td>
</tr>
<tr>
<td>120 mg daily</td>
<td>‘50’ patch</td>
</tr>
<tr>
<td>180 mg daily</td>
<td>‘75’ patch</td>
</tr>
<tr>
<td>240 mg daily</td>
<td>‘100’ patch</td>
</tr>
</tbody>
</table>

Fentanyl equivalences in this table are for children on well-tolerated opioid therapy for long periods; fentanyl patches should not be used in opioid naive children. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

Symptom control

Unlicensed indications or routes Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 421 or dexamethasone p. 419.

Anxiety Anxiety can be treated with a long-acting benzodiazepine such as diazepam p. 212, or by continuous infusion of the short-acting benzodiazepine midazolam p. 215. Interventions for more acute episodes of anxiety (such as panic attacks) include short-acting benzodiazepines such as lorazepam p. 214 given sublingually or midazolam given subcutaneously. Temazepam p. 790 provides useful night-time sedation in some children.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 80 by mouth; treatment is usually continued for one week after the bleeding has stopped but it can be continued at a reduced dose if bleeding persists. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 80 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 132 can be applied to the affected area.

Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives. Suitable laxatives include osmotic laxatives (such as lactulose p. 40 or macrogols), stimulant laxatives (such as co-danthramer p. 44 and senna p. 45) or the combination of lactulose and a senna preparation. Naloxone hydrochloride p. 813 given by mouth may help relieve opioid-induced constipation; it is poorly absorbed but opioid withdrawal reactions have been reported.

Convulsions Intractable seizures are relatively common in children dying from non-malignant conditions. Phenobarbital p. 208 by mouth or as a continuous subcutaneous infusion may be beneficial; continuous infusion of midazolam p. 215 is an alternative. Both cause drowsiness, but this is rarely a concern in the context of intractable seizures. For breakthrough convulsions diazepam p. 212 given rectally (as a solution), buccal midazolam, or paraldehyde p. 215 as an enema may be appropriate. See Continuous subcutaneous infusions, below, for the use of midazolam by subcutaneous infusion using a continuous infusion device.

Dry mouth Dry mouth may be caused by certain medications including opioid analgesics, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics;
if possible, an alternative preparation should be considered. Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 680 or miconazole p. 680, alternatively, fluconazole p. 358 can be given by mouth.

**Dysphagia** A corticosteroid such as dexamethasone p. 419 may help, temporarily, if there is an obstruction due to tumour. See also Dry mouth, above.

**Dyspnoea** Breathlessness at rest may be relieved by regular oral morphine p. 271 in carefully titrated doses. Diazepam p. 212 may be helpful for dyspnoea associated with anxiety. Sublingual lorazepam p. 214 or subcutaneous or buccal midazolam p. 215 are alternatives. A nebulised short-acting beta; agonist or a corticosteroid, such as dexamethasone p. 419 or prednisolone p. 421, may also be helpful for bronchospasm or partial obstruction.

**Excessive respiratory secretion** Excessive respiratory secretion (death rattle) may be reduced by hyoscine hydrobromide patches or by subcutaneous or intravenous injection of hyoscine hydrobromide p. 256, however, care must be taken to avoid the discomfort of dry mouth. Alternatively, glycopyrronium bromide p 780 may be given. Hyoscine hydrobromide can be administered by subcutaneous or intravenous infusion using a continuous infusion device.

**Fungating tumours** Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 319 is often required to reduce malodour, but topical metronidazole p. 692 is also used.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide hydrochloride p. 47. Hyoscine hydrobromide p. 256 may also be helpful in reducing the frequency of spasms; it is given subcutaneously as Kwells® tablets and also by subcutaneous infusion. Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone before meals.

**Hiccups** Hiccups, due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent.

**Insomnia** Children with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzo diazepines, such as temazepam p. 790, may be useful.

**Intractable cough** Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 271 every 4 hours. Methadone hydrochloride linctus p. 286 should be avoided because it has a long duration of action and tends to accumulate.

**Mucosal bleeding** Mucosal bleeding from the mouth and nose occurs commonly in the terminal phase, particularly in a child suffering from haemopoietic malignancy. Bleeding from the nose caused by a single bleeding point can be arrested by cautery or by dressing it. Tranexamic acid p. 80 may be effective applied topically or given systemically.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 212 or baclofen p. 620.

**Nausea and vomiting** Nausea and vomiting are common in children with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. Nausea and vomiting with opioid therapy are less common in children than in adults but may occur particularly in the initial stages and can be prevented by giving an antiemetic. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide hydrochloride p. 252 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with anti muscarinic effects antagonise prokinetic drugs and, if possible, should not therefore be used concurrently. Haloperidol p. 237 is used by mouth or by continuous intravenous or subcutaneous infusion for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 250 is used for nausea and vomiting due to mechanical bowel obstruction, raised intracrural pressure, and motion sickness. Ondansetron p. 253 is most effective when the vomiting is due to damaged or irritated gut mucosa (e.g. after chemotherapy or radiotherapy).

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one. Levomepromazine p. 257 can be used if first-line antiemetics are inadequate. Dexamethasone p. 419 by mouth can be used as an adjunct. See Continuous subcutaneous infusions, below, for the administration of antiemetics by subcutaneous infusion using a continuous infusion device.

**Pruritus** Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. Ondansetron p. 253 may be effective in some children. Where opioid analgesics cause pruritus it may be appropriate to review the dose or to switch to an alternative opioid analgesic. In the case of obstructive jaundice, further measures include administration of colestyramine p. 125.

**Raised intracranial pressure** Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 419, for 4 to 5 days, subsequently reduced if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia. Treatment of headache and of associated nausea and vomiting should also be considered.

**Restlessness and confusion** Restlessness and confusion may require treatment with haloperidol p. 237. Levomepromazine p. 257 is also used occasionally for restlessness.

**Continuous subcutaneous infusions** Although drugs can usually be administered by mouth to control symptoms in palliative care, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections should be avoided in children, particularly if cachectic. This has led to the use of portable continuous infusion devices such as syringe drivers to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- inability to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma;
- malignant bowel obstruction for which surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- refusal by the child to take regular medication by mouth.

**Syringe driver rate settings** Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.
Bowel colic and excessive respiratory secretions  Hyoscine hydrobromide p. 256 effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a subcutaneous or intravenous infusion. Glycopyrronium bromide p. 780 may also be used.Hyoscine butylbromide p. 61 is effective in bowel colic, is less sedative than hyoscine hydrobromide, but it is not always adequate for the control of respiratory secretions; it is given by subcutaneous infusion (important: hyoscine butylbromide must not be confused with hyoscine hydrobromide, above).

Confusion and restlessness  Haloperidol p. 237 has little sedative effect. Levomepromazine p. 257 has a sedative effect. Midazolam p. 215 is a sedative and an antiepileptic that may be suitable for a very restless patient.

Convulsions  If a child has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 215 is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

Nausea and vomiting  Levomepromazine p. 257 causes sedation in about 50% of patients. Haloperidol p. 237 has little sedative effect. Cyclizine p. 250 is particularly likely to precipitate if mixed with diamorphine hydrochloride p. 267 or other drugs (see under Mixing and compatibility); it is given by subcutaneous infusion.

Pain control  Diamorphine hydrochloride p. 267 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and compatibility). The table shows approximate equivalent doses of morphine and diamorphine hydrochloride.

Mixing and compatibility  The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 236, prochlorperazine p. 258, and diazepam p. 212 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 250 and levomepromazine p. 257 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 561) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Compatibility with diamorphine  Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

The following can be mixed with diamorphine:

- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.

- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers  The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

### Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

If breakthrough pain occurs give a subcutaneous injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. With an intermittent subcutaneous injection absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Drugs and sport

Anti-doping
UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:
UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
Tel: (020) 7842 3450

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

General Medical Council’s advice
Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.

Prescribing in dental practice

General guidance
Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections.
The following is a list of topics of particular relevance to dentists.

Prescribing by dentists, see Prescription writing p. 5
Oral side-effects of drugs, see Adverse reactions to drugs p. 12
Medical emergencies in dental practice, see BNF
Medical problems in dental practice, see BNF

Drug management of dental and oral conditions

1 Chronic bowel disorders

Overview
Individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Clostridium difficile infection
Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of antibiotic treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Complications of Clostridium difficile infection are usually of acute onset, but may become chronic. It is a particular hazard of antibiotic treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Crohn’s disease
Description of condition
Crohn’s disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn’s disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss, and rectal bleeding.

Non-drug treatment
In addition to drug treatment, management options for Crohn’s disease include smoking cessation and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain children with early disease limited to the distal ileum and in severe or chronic active disease.
Drug treatment

Treatment of acute disease

Monotherapy

A corticosteroid (either prednisolone p. 421 or methylprednisolone p. 421 or intravenous hydrocortisone p. 420), is used to induce remission in children with a first presentation or a single inflammatory exacerbation of Crohn’s disease in a 12-month period.

Enteral nutrition is an alternative to a corticosteroid when there is concern about growth or side effects.

In children with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 31 [unlicensed] may be considered. Budesonide is less effective but may cause fewer side effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 30 and mesalazine p. 27) are an alternative option in these children. They are less effective than a corticosteroid or budesonide [unlicensed], but may be preferred because they have fewer side effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations.

Add-on treatment

Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 495 or mercaptopurine p. 516 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In children who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 517 can be added to a corticosteroid.

Under specialist supervision, monoclonal antibody therapies, adalimumab p. 614 and infliximab p. 31, are options for the treatment of severe, active Crohn’s disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. See also National funding/access decisions for adalimumab and infliximab.

Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant, although there is uncertainty about the comparative effectiveness. There are concerns about the long-term safety of adalimumab and infliximab in children;
malignancies, including hepatosplenic T-cell lymphoma, have been reported.

Maintenance of remission

Children, and their parents or carers, should be made aware of the risk of relapse with and without drug treatment, and symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in children who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate [unlicensed] can be used to maintain remission only in children who required methotrexate to induce remission, who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used.

Maintaining remission following surgery

Azathioprine or mercaptopurine can be considered to maintain remission after surgery in children with adverse prognostic factors such as more than one resection, or previously complicated or debilitating disease (for example, abscess, involvement of adjacent structures, fistulating or penetrating disease). Aminosalicylates can also be considered as an option, however budesonide or enteral nutrition should not be used.

Other treatments

Loperamide hydrochloride p. 47 can be used to manage diarrhoea associated with Crohn’s disease in children who do not have colitis. Colestyramine p. 125 is licensed for the relief of diarrhoea associated with Crohn’s disease. See also Acute diarrhoea p. 46.

Fistulating Crohn’s disease

Perianal fistulae are the most common occurrence in children with fistulating Crohn’s disease. Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with medical therapy.

Metronidazole p. 319 or ciprofloxacin p. 333 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely. Metronidazole should be given for at least 6 weeks but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine p. 495 or mercaptopurine p. 516 [unlicensed indications] is used to control the inflammation in perianal and enterocutaneous fistulating Crohn’s disease and they are continued for maintenance.

Infliximab p. 31 is recommended for children with perianal and enterocutaneous active fistulating Crohn’s disease who have not responded to conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine, mercaptopurine or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn’s disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach.

Ulcerative colitis

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing–remitting pattern. It is a life-long disease that is associated with significant morbidity. Ulcerative colitis is more common in adults; however in children it predominately presents between the ages of 5 and 16 years.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as proctitis, and inflammation of the rectum and sigmoid colon as proctosigmoiditis. Left-sided colitis refers to disease involving the colon distal to the splenic flexure. Extensive colitis affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Child-onset ulcerative
Ulcerative colitis is classified as extensive in 60–80 % of all cases. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Ulcerative colitis is classified as subacute if it is moderate-to-severely active disease which can be managed in an outpatient setting, and does not require hospitalisation or consideration of urgent surgical intervention.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism and toxic megacolon. Growth and puberal development can be affected in children.

**Aims of treatment**

Treatment is focussed on treating active disease to manage symptoms and to induce and maintain remission.

**Drug treatment**

**Overview**

Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and the child’s preference. As limited distal disease is uncommon in children, treatment strategy depends mainly on disease severity rather than the extent of disease. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment.

Severity is classified as mild, moderate or severe (or in remission) by using the Paediatric Ulcerative Colitis Activity Index to assess bowel movement, limitations on daily activity and the presence of abdominal pain or melaena—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used.

If the inflammation is distal, a rectal preparation is adequate, but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the child’s preferences.

Rectal foam preparations and suppositories can be used when children have difficulty retaining liquid enemas. Diarrhoea that is associated with active ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 47 [unlicensed under 4 years]) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 41) may be useful for proximal faecal loading in proctitis. Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release factors such as clinical severity, extent of disease, and the child’s preference. As limited distal disease is uncommon in children, treatment strategy depends mainly on disease severity rather than the extent of disease. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment.

Severity is classified as mild, moderate or severe (or in remission) by using the Paediatric Ulcerative Colitis Activity Index to assess bowel movement, limitations on daily activity and the presence of abdominal pain or melaena—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used.

If the inflammation is distal, a rectal preparation is adequate, but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the child’s preferences.

Rectal foam preparations and suppositories can be used when children have difficulty retaining liquid enemas. Diarrhoea that is associated with active ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 47 [unlicensed under 4 years]) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 41) may be useful for proximal faecal loading in proctitis. Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release factors such as clinical severity, extent of disease, and the child’s preference. As limited distal disease is uncommon in children, treatment strategy depends mainly on disease severity rather than the extent of disease. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment.

Severity is classified as mild, moderate or severe (or in remission) by using the Paediatric Ulcerative Colitis Activity Index to assess bowel movement, limitations on daily activity and the presence of abdominal pain or melaena—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used.

If the inflammation is distal, a rectal preparation is adequate, but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the child’s preferences.

Rectal foam preparations and suppositories can be used when children have difficulty retaining liquid enemas. Diarrhoea that is associated with active ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 47 [unlicensed under 4 years]) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 41) may be useful for proximal faecal loading in proctitis. Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

**Treatment of acute mild-to-moderate ulcerative colitis**

Acute treatment to induce remission generally consists of an aminosalicylate with or without a corticosteroid.

Aminosalicylates are recommended as first-line treatment for children at first presentation or with an exacerbation. Oral aminosalicylates (balsalazide sodium p. 27 [unlicensed], mesalazine p. 27 [unlicensed under 6 years], olsalazine sodium p. 30 [unlicensed under 12 years] or sulfasalazine p. 30 [unlicensed under 2 years]) are recommended as first line except in children with proctitis or proctosigmoiditis where a rectal aminosalicylate (mesalazine or sulfasalazine [both unlicensed under 6 years]) is more effective. A rectal corticosteroid (budesonide p. 31 [unlicensed], hydrocortisone p. 420 [unlicensed under 2 years] or prednisolone p. 421) or oral prednisolone [unlicensed under 2 years] alone can be considered in children with proctitis or proctosigmoiditis who are intolerant to or decline treatment with aminosalicylates, or in whom aminosalicylates are contra-indicated.

Addition of oral beclometasone dipropionate p. 154 [unlicensed] or a rectal aminosalicylate to oral aminosalicylate treatment may also be considered in children with left-sided or extensive disease. Oral prednisolone [unlicensed under 2 years] alone is recommended for children who cannot tolerate or who decline aminosalicylates, or in whom aminosalicylates are contra-indicated.

Oral prednisolone [unlicensed under 2 years] should be considered for the treatment of children with subacute proctitis or proctosigmoiditis.

In all extents of disease, if there are no improvements within four weeks of initial treatment or if symptoms worsen, addition of oral prednisolone to aminosalicylate therapy can be considered (discontinue beclometasone dipropionate if adding oral prednisolone). If there is still no response after 2–4 weeks of treatment with prednisolone, consider adding oral tacrolimus p. 499 [unlicensed indication] to prednisolone to induce remission.

Alternatively, on specialist advice, infliximab p. 31 [unlicensed indication; can be used in children over 6 years] or intravenous tacrolimus [unlicensed indication] can be added, if there is no response after 2–4 weeks of treatment with prednisolone.

Evaluation of response should be done early to allow tapering of corticosteroids and ongoing treatment. Unnecessary corticosteroid exposure is to be avoided to minimise growth retardation and other corticosteroid-related side effects.

**Treatment of acute severe ulcerative colitis**

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency.

Immediate hospital admission is required for treatment.

Intravenous corticosteroids (such as hydrocortisone or methylprednisolone p. 421) should be given to induce remission in children with acute severe ulcerative colitis (whether it is a first presentation or an inflammatory exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 496 [unlicensed indication], or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for children who have little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid.

Alternately, infliximab can be used on specialist advice in children over 6 years, if there is little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude pathogens; cytomegalovirus activation should be considered.

**Infliximab for ulcerative colitis**

Infliximab p. 31 can be used to treat acute severe active ulcerative colitis in children over 6 years who have had an inadequate response to conventional treatment (including corticosteroids and azathioprine p. 495 or mercaptopurine p. 516) or if conventional treatment is not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase if effective and tolerated. See also National funding/access decisions for infliximab.
Infliximab can also be used to treat acute exacerbations of severely active ulcerative colitis in children over 6 years, if ciclosporin p. 496 is contra-indicated or clinically inappropriate. ▶

Maintaining remission in mild, moderate or severe ulcerative colitis
▶
To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most children. Corticosteroids are not suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of proctitis or proctosigmoiditis, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in children who prefer not to use enemas or suppositories, although, this may not be as effective.

A low dose of oral aminosalicylate is given to maintain remission in children after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis. ▶

Oral aminosalicylates are available in different preparations and release forms. ▶
The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the child. When used to maintain remission single daily dosing of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine or mercaptopurine [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that require treatment with systemic corticosteroids or if remission is not maintained by aminosalicylates, or following a single acute severe episode. ▶

Oral azathioprine or mercaptopurine is usually required in these cases as an aminosalicylate alone may be ineffective in more severe disease.

There is no evidence to support the use of methotrexate p. 517 to induce or maintain remission in ulcerative colitis though its use is common in clinical practice.

Non-drug treatment
▶
Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life. ▶

Useful Resources

Aminosalicylates

Aminosalicylates
▶
- **SIDE-EFFECTS**
  - **Rare** Acute pancreatitis • agranulocytosis • alopecia • aplastic anaemia • arthralgia • blood disorders • eosinophilia • fibrosing alveolitis • hepatitis • interstitial nephritis • leucopenia • lung disorders • lupus erythematosus-like syndrome • methaemoglobinemia • myalgia • myocarditis • nephrotic syndrome • neutropenia • pericarditis • peripheral neuropathy • renal dysfunction • skin reactions • Stevens-Johnson syndrome • thrombocytopenia
  - **Frequency not known** Abdominal pain • diarrhoea • exacerbation of symptoms of colitis • headache • hypersensitivity reactions • nausea • rash • urticaria • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Blood Disorders** A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in salicylate hypersensitivity.
- **RENAL IMPAIRMENT** Renal function should be monitored more frequently in renal impairment.
- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.
- **PATIENT AND CARER ADVICE**
  - Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

**Balsalazide sodium**

- **INDICATIONS AND DOSE**
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - **BY MOUTH**
    - Child 12-17 years: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

**Maintenance of remission of ulcerative colitis**
- **BY MOUTH**
- Child 12-17 years: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- **UNLICENSED USE** Not licensed for use in children under 18 years.
- **CAUTIONS** History of asthma
- **INTERACTIONS** → Appendix 1: balsalazide
- **SIDE-EFFECTS** Cholelithiasis
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Treatment of acute attack, ulcerative proctitis, affecting the rectosigmoid region**
- Child 12-17 years: 1 g daily for 2–4 weeks

**Maintenance, ulcerative proctitis**
- Child 12-17 years: 1 g daily

*BY RECTUM*

**ASACOL® RETENTION ENEMA**
- Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region
  - Child 12-17 years: 1 g once daily, dose to be administered at bedtime

**PENTASA® RETENTION ENEMA**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3 divided doses

**Maintenance of remission of ulcerative colitis**
- Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 40 kg and above): 2 g once daily

*BY RECTUM*

**ASACOL® SUPPOSITORIES**
- Treatment and maintenance of remission of ulcerative colitis affecting the rectosigmoid region
  - Child 12-17 years: 250–500 mg 3 times a day, last dose to be administered at bedtime

**IPOCOL®**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 6-17 years (body-weight 40 kg and above): 800 mg 3 times a day

**Maintenance of remission of ulcerative colitis**
- Child 6-17 years (body-weight 40 kg and above): 1.2–2 g daily in divided doses

**OCTASA®**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 6-17 years (body-weight 40 kg and above): 2.4–4 g daily in divided doses

**Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis**
- Child 6-17 years (body-weight 40 kg and above): 1.2–2 g once daily, alternatively daily in divided doses

**PENTASA® GRANULES**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses

**Maintenance of remission of ulcerative colitis**
- Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 40 kg and above): 2 g once daily

**PENTASA® TABLETS**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3 divided doses

**Maintenance of remission of ulcerative colitis**
- Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 40 kg and above): 2 g once daily

**SALOFALK® ENEMA**
- Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission
  - Child 12-17 years: 2 g once daily, dose to be administered at bedtime

**SALOFALK® GRANULES**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day

**SALOFALK® RECTAL FOAM**
- Treatment of mild ulcerative colitis affecting sigmoid colon and rectum
  - Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

**SALOFALK® SUPPOSITORIES**
- Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon
  - Child 12-17 years: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

**SALOFALK® TABLETS**
- Treatment of mild to moderate ulcerative colitis, acute attack
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**
- Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
Children 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day

Dose equivalence and conversion
There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Unlicensed use
With oral use Asacol® (all preparations) not licensed for use in children under 18 years. Pentasa® tablets not licensed for use in children under 15 years. Pentasa® granules and Salofalk® tablets and granules not licensed for use in children under 6 years.

With rectal use Asacol® (all preparations) and Salofalk® enema not licensed for use in children under 18 years. Salofalk® suppositories and Pentasa® suppositories not licensed for use in children under 15 years. Salofalk® rectal foam no dose recommendations for children (age range not specified by manufacturer).

Contra-indications
Blood clotting abnormalities
Caution Pulmonary disease
Interactions Appendix 1: mesalazine
Side-effects Rare Dizziness
Pregnancy Negligible quantities cross placenta.
Breastfeeding Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk. Monitor breast-fed infant for diarrhoea.
Hepatic impairment Avoid in severe impairment.
Renal impairment Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

Directions for administration
Pentasa® Tablets Tablets may be halved, quartered, or dispersed in water, but should not be chewed.
Salofalk® Granules Granules should be placed on tongue and washed down with water without chewing.
Pentasa® Granules Granules should be placed on tongue and washed down with water or orange juice without chewing.

Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

Prescribing and dispensing information
There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of Salofalk® may include vanilla.

Patient and carer advice
If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms.

Some products may require special administration advice; patients and carers should be informed.

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn’s disease

- **BY MOUTH**
  - Child 2-11 years: 10–15 mg/kg 4–6 times a day (max. per dose 1 g) until remission occurs; increased if necessary up to 60 mg/kg daily in divided doses
  - Child 12-17 years: 1–2 4 times a day until remission occurs

- **BY RECTUM**
  - Child 5-7 years: 500 mg twice daily
  - Child 8-11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
  - Child 12-17 years: 0.5–1 g twice daily

**Maintenance of remission of mild to moderate and severe ulcerative colitis**

- **BY MOUTH**
  - Child 2-11 years: 5–7.5 mg/kg 4 times a day (max. per dose 500 mg)
  - Child 12-17 years: 500 mg 4 times a day

- **BY RECTUM**
  - Child 5-7 years: 500 mg twice daily
  - Child 8-11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
  - Child 12-17 years: 0.5–1 g twice daily

- **UNLICENSED USE** Not licensed for use in children for juvenile idiopathic arthritis.

- **CONTRA-INDICATIONS** Child under 2 years of age

- **CAUTIONS** Acute porphyrias p. 577 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status

- **INTERACTIONS** → Appendix 1: sulfasalazine

- **SIDE-EFFECTS**
  - Common or very common Blood disorders · cough · dizziness · fever · Heinz body anaemia · insomnia · megaloblastic anaemia · proteinuria · pruritus · stomatitis · taste disturbances · tinnitus
  - Uncommon Alopecia · convulsions · depression · dyspnoea · vasculitis
  - Frequency not known Anaphylaxis · aseptic meningitis · ataxia · crystalluria · disturbances of smell · episcleral necrolysis · exfoliative dermatitis · gastro-intestinal intolerance · hallucinations · hypersensitivity reactions · leucopenia (especially in patients with rheumatoid arthritis) · loss of appetite · neutropenia (especially in patients with rheumatoid arthritis) · oligospermia · parotitis · photosensitivity · rashes · serum sickness · some soft contact lenses may be stained · thrombocytopenia (especially in patients with rheumatoid arthritis) · yellow-orange discolouration of other body fluids · yellow-orange discoloration of skin · yellow-orange discoloration of urine

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal side effects Upper gastro-intestinal side-effects common over 4 g daily.

- Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

- **PREGNANCY** Theoretical risk of neonatal haemolyis in third trimester; adequate folate supplements should be given to mother.

- **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolyis especially in G6PD-deficient infants.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENA L IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.

**Severe active Crohn’s disease**
- **BY INTRAVENOUS INFUSION**
  - Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, then maintenance 5 mg/kg every 8 weeks, interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial dose

**Fistulating Crohn’s disease**
- **BY INTRAVENOUS INFUSION**
  - Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

**Severe active ulcerative colitis**
- **BY INTRAVENOUS INFUSION**
  - Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 8 weeks of initial dose

**UNLICENSED USE** Not licensed for fistulating Crohn’s disease in children.

**IMPORTANT SAFETY INFORMATION**

Adequate resuscitation facilities must be available when infliximab is used.

**CONTRA-INDICATIONS** Moderate or severe heart failure - severe infections

**CAUTIONS** Demyelinating disorders (risk of exacerbation) - dermatomyositis - development of malignancy - hepatitis B virus — monitor for active infection - history of malignancy - history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection (discontinue if new serious infection develops) - risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-
Tuberculosis

Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).

- Hypersensitivity reactions
  - Hyper-sensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

- Interactions
  - Appendix 1: monoclonal antibodies

- Side-effects
  - Common or very common
    - Alopecia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dyspepsia · ecchymosis · epistaxis · flushing · gastro-intestinal haemorrhage · gastro-oesophageal reflux · hyperhidrosis · hypertension · hypeoesthesia · hypotension · myalgia · new onset or worsening psoriasis · palpititation · paraesthesia · rash · sleep disturbances · tachycardia
  - Uncommon
    - Abnormal skin pigmentation · agitation · amnesia · arthralgia · bradycardia · bullous eruption · chelitis · cholecytitis · confusion · eye disorders · heart failure · hepatitis · hyperkeratosis · impaired healing · intestinal perforation · nervousness · neuropathy · pancreatitis · peripheral ischaemia · pleurisy · pulmonary oedema · rosacea · seborrhoea · seizures · syncope · vaginitis
  - Rare
    - Demyelinating disorders · interstitial lung disease · leukaemia · lymphoma · melanoma · pericardial effusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasospasm

- Frequency not known
  - Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · depression · fever · headache · hepatic failure · hepatosplenic T-cell lymphoma (more likely in inflammatory bowel disease) · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · Merkel cell carcinoma · nausea · pancytopenia · pruritus · thrombocytopenia · worsening heart failure · worsening symptoms of dermatomyositis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- Conception and Contraception
  - Manufacturer advises adequate contraception during and for at least 6 months after last dose.

- Pregnancy
  - Use only if essential.

- Breast Feeding
  - Amount probably too small to be harmful.

- Pre-Treatment Screening
  - Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

- Monitoring Requirements
  - Monitor for infection before, during, and for 6 months after treatment.
  - All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
  - Manufacturer advises to observe skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

- Directions for Administration
  - For intravenous infusion reconstitute each 100-mg vial of powder with 10 mL Water for Injections; to dissolve, gently swirl vial without shaking; allow to stand for 5 minutes; dilute required dose with Sodium Chloride 0.9% to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours; start infusion within 3 hours of reconstitution.

- Prescribing and Dispensing Information
  - Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

- Patient and Carer Advice
  - An alert card should be provided.
  - Tuberculosis: Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss, and fever) develop.

- Blood disorders
  - Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

- Hypersensitivity reactions
  - Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

- National Funding/Access Decisions

NICE technology appraisals (TAs)

- Infliximab for Crohn’s disease (May 2010) NICE TA187
  - In children over 6 years of age, infliximab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response, and primary nutrition therapy) or when conventional therapy cannot be used because of intolerance or contra-indications.
  - Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.
  - www.nice.org.uk/TA187

- Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329
  - Infliximab is an option for treating severely active ulcerative colitis in children whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine.
  - Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed every 12 months.
1.2 Coeliac disease

Coeliac disease 25-Jul-2016

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see Borderline substances).

Drug treatment

Children who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Supplementation of key nutrients may be required if dietary intake is insufficient.

Carers of children who have coeliac disease should be advised not to medicate with over-the-counter vitamin or mineral supplements. Initiation of supplementation should involve a discussion with a member of the child’s healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Useful Resources

1.3 Irritable bowel syndrome

Irritable bowel syndrome 24-Feb-2016

Description of condition

Irritable bowel syndrome (IBS) is a gastrointestinal disorder characterised by abdominal pain or discomfort that may be relieved by defaecation. It can also be associated with the passage of mucus, bloating, and disordered defaecation; either diarrhoea, constipation, or alternating diarrhoea and constipation. Constipation presents with straining, urgency, and a sensation of incomplete evacuation. Before a diagnosis of IBS is made, the symptoms should be present at least once per week for at least 2 months and other potential pathological causes of the symptoms should be excluded. IBS symptoms are often aggravated by psychological factors, such as anxieties, emotional stress, and fear.

Aims of treatment

Treatment of IBS is focused on symptom control in order to improve quality of life, including minimising abdominal pain and normalising the frequency and consistency of stools.

Non-drug treatment

There is no evidence of the effectiveness of any form of dietary advice or increased fibre intake in children and it is not known whether dietary advice recommended to adult patients is of benefit to children.

Eating regularly, limiting fresh fruit intake, and reducing intake of ‘resistant starch’ and insoluble fibre (e.g. bran) can be recommended. If an increase in dietary fibre is required, soluble fibre such as oats, ispaghula husk p. 39, or sterculia p. 40 can be recommended. Ensuring a sufficient intake of fluids can also be recommended.

Drug treatment

Clinicians should only prescribe drugs for children with IBS in cases of severe symptoms that have not responded to non-drug approaches. Treatment options include laxatives, antimotility drugs or antispasmodic drugs.

A laxative can be used to treat abdominal pain if the underlying cause is suspected to be constipation. An osmotic laxative, such as a macrocol or lactulose p. 40, is preferred; lactulose may cause flatulence during the first few days of treatment. Loperamide hydrochloride p. 47 may relieve diarrhoea and antispasmodic drugs may relieve pain.

Other drugs used for Irritable bowel syndrome

Alverine citrate p. 62 · Mebeverine hydrochloride. p. 62

ANTISPASMODICS

Mebeverine with ispaghula husk 04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 62, ispaghula husk p. 39.

• INDICATIONS AND DOSE

Irritable bowel syndrome

• BY MOUTH

• Child 12–17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

• INTERACTIONS → Appendix 1: mebeverine
Peppermint oil

**INDICATIONS AND DOSE**

**COLPERMIN®**

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- **BY MOUTH**
  - Child 15–17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

**CAUTIONS**
- Sensitivity to menthol
- **INTERACTIONS** → Appendix 1: peppermint oil

**SIDE-EFFECTS**
- **Rare** Allergic reactions • ataxia • bradycardia • headache • muscle tremor • rash
- **Frequency not known** Heartburn • perianal irritation
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Significant levels of menthol in breast milk unlikely.

**DIRECTIONS FOR ADMINISTRATION** Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Modified-release capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 5, 22, 25
  - **EXCIPIENTS:** May contain Arachis (peanut) oil
  - **Colpermin** (McNeil Products Ltd)
    - Peppermint oil **200 microlitre** Colpermin gastro-resistant modified-release capsules | 20 capsule **GSL** £3.33 | 100 capsule **GSL** £12.18 DT price = £12.18

**1.4 Short bowel syndrome**

**Short bowel syndrome**

**Description of condition**

Children with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

**Aims of treatment**

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

**Drug treatment**

**Nutritional deficiencies**

Children with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B₁₂, D, E, and K, essential fatty acids, zinc and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see Magnesium p. 570), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfalcacidol p. 603 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure.

**Diarrhoea and high output stomas**

Diarrhoea is a common symptom of short bowel syndrome and can be due to multiple factors. The use of oral rehydration salts can be considered in order to promote adequate hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A child may require parenteral nutrition to allow them to eat less if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection.

**Antimotility drugs**

Loperamide hydrochloride p. 47 reduces intestinal motility and thus exerts antidiarrhoeal actions. Loperamide hydrochloride is preferred over other antimotility drugs as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in children with a short bowel due to disrupted enterohepatic circulation and a rapid gastro-intestinal transit time.

Co-phenotrope p. 47 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood–brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use.

**Colestyramine**

In children with an intact colon and less than 100 cm of ileum resected, colestyramine p. 125 can be used to bind the unabsorbed bile salts, which reduces diarrhoea. When colestyramine is given to these children, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies.

**Antisecretory drugs**

Drugs that reduce gastric acid secretion reduce jejunostomy output. Omeprazole p. 57 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously.

Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts).

**Growth factors**

Growth factors can be used to facilitate intestinal adaptation after surgery in children with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide p. 35 is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome in children aged one year and over. It may be considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.
Drug absorption
For Prescribing in children with stoma see Stoma care p. 72. 
Many drugs are incompletely absorbed by children with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously.

Several factors can alter the absorption of drugs taken by mouth in children with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug absorption will be affected. Other factors such as gastric emptying and gastric transit time also affect drug handling.

Dosage forms with quick dissolution (such as soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. Before prescribing liquid formulations, prescribers should consider the osmolarity, excipient content, and volume required. Hyperosmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken.

AMINO ACIDS AND DERIVATIVES
Teduglutide

Drug action
Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

Indications and dose
Short bowel syndrome (initiated under specialist supervision)
- BY SUBCUTANEOUS INJECTION
  - Child 1-17 years: 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 12 weeks

Contra-indications
Active or suspected malignancy • history of gastro-intestinal malignancy (in previous 5 years)

Caution
Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) • cardiac insufficiency • cardiovascular disease • colo-rectal polyps • hypertension

Caution, further information
- Colo-rectal polyps Manufacturer recommends faecal occult blood testing in children before initiation of treatment and yearly thereafter. Manufacturer also advises colonoscopy or sigmoidoscopy in children aged 12 years and older before initiation of treatment, after 1 year of treatment and then every 5 years thereafter. Colonoscopy or sigmoidoscopy should be performed in all children with unexplained blood in stool.

Side-effects
- Common or very common Abdominal distension • abdominal pain • allergic dermatitis • anxiety • arthralgia • chest pain • cholecystitis • cholestasis • congestive heart failure • cough • decreased appetite • dyspnoea • flushing • headache • intestinal obstruction • nausea • night sweats • pancreatitis • paraesthesia • peripheral oedema • rash • renal colic • sleep disorder • vomiting
- Uncommon Syncope
- Frequency not known Gastro-intestinal neoplasia • pancreatic duct stenosis • pancreatic infection

Allergy and cross-sensitivity
Manufacturer advises caution in patients with tetracycline hypersensitivity.

Pregnancy
Specialist sources indicate use if necessary—no human data available.

Breast feeding
Manufacturer advises avoid—toxicity in animal studies.

Renal impairment
Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

Monitoring requirements
Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

Treatment cessation
Caution when discontinuing treatment—risk of dehydration.

Patient and carer advice
Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- Revestive (Shire Pharmaceuticals Ltd) Teduglutide 5 mg Revestive 5mg powder and solvent for solution for injection vials 12 vial [PAX] no price available

2 Constipation and bowel cleansing
2.1 Bowel cleansing
Other drugs used for Bowel cleansing Bisacodyl, p. 44 • Docusate sodium, p. 43

Diagnostic agents > Radiographic contrast media
Meglumine amidotrizoate with sodium amidotrizoate (Diatrizoates)

Drug action
Meglumine amidotrizoate with sodium amidotrizoate is a radiological contrast medium with high osmolality.

Indications and dose
Uncomplicated meconium ileus
- BY RECTUM
- Neonate: 15–30 mL for 1 dose.

Distal intestinal obstruction syndrome in children with cystic fibrosis
- BY MOUTH, OR BY RECTUM
  - Child 1-23 months: 15–30 mL for 1 dose
  - Child (body-weight 15–25 kg): 50 mL for 1 dose
  - Child (body-weight 26 kg and above): 100 mL for 1 dose

Radiological investigations
Child: Dose to be recommended by radiologist

Unlicensed use
Not licensed for use in distal intestinal obstruction syndrome.
**LAXATIVES**

### Citric acid with magnesium carbonate

**Formulated as a bowel cleansing preparation**

**INDICATIONS AND DOSE**

**Bowel evacuation for surgery, colonoscopy or radiological examination**

- **BY MOUTH**
  - Child 5–9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure.
  - Child 10–17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure.

**CONTRA-INDICATIONS**

- Acute severe colitis - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - toxic megacolon

**CAUTIONS**

- Children - colitis (avoid if acute severe colitis) - debilitated - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration - patients with fluid and electrolyte disturbances

### Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride

**Formulated as a bowel cleansing preparation**

**INDICATIONS AND DOSE**

**Bowel cleansing before radiological examination, colonoscopy, or surgery**

- **INITIALLY BY MOUTH**
  - Child 12–17 years: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed
Distal intestinal obstruction syndrome
- BY MOUTH, OR BY NASOGASTRIC TUBE, OR BY GASTROSTOMY TUBE
- Child 1-17 years: 10 mL/kilogram/hour for 30 minutes, then increased to 20 mL/kilogram/hour for 30 minutes, then increased if tolerated to 25 mL/kilogram/hour, max. 100 mL/kg (or 4 litres) over 4 hours, repeat 4 hour treatment if necessary

- **UNLICENSED USE** Klean-Prep® not licensed for use in children.
- **CONTRA-INDICATIONS** Acute severe colitis • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • gastro-intestinal ulceration • toxic megacolon
- **CAUTIONS** Children • colitis (avoid if acute severe colitis) • debilitated patients • fluid and electrolyte disturbances • heart failure • hypovolaemia (should be corrected before administration of bowel cleansing preparations) • impaired gag reflex or possibility of regurgitation or aspiration
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distention • abdominal pain • nausea • vomiting
  - **Uncommon** Anal discomfort • dehydration • dizziness • electrolyte disturbances • headache
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Manufacturers advise use only if essential—no information available.
- **BREAST FEEDING** Manufacturers advise use only if essential—no information available.
- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION** 1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** Each Klean-Prep® sachet provides Na+ 125 mmol, K+ 10 mmol, Cl− 35 mmol and HCO3− 20mmol when reconstituted with 1 litre of water.
- **PATIENT AND CARER ADVICE** Solid food should not be taken for 2 hours before starting treatment. Adequate hydration should be maintained during treatment. Treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS**
  - Powder
    - **CAUTIONARY AND ADVISORY LABELS** 10, 13
    - **EXCIPIENTS**: May contain Aspartame
    - **ELECTROLYTES**: May contain Bicarbonate, chloride, potassium, sodium
    - **Klean-Prep** (Norgine Pharmaceuticals Ltd)
      - Potassium chloride 742.5 mg, Sodium chloride 1.465 gram, Sodium bicarbonate 1.685 gram, Sodium sulfate anhydrous 5.685 gram, Polyethylene glycol 3350 59 gram

  - **FORMULATION**
    - Powder 69g sachets sugar-free | 4 sachet pack £9.98

LAXATIVES \> STIMULANT LAXATIVES

**Magnesium citrate with sodium picosulfate**
(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  - **PICOLAX® SACHETS**
    - **Bowel evacuation on day before radiological procedure, endoscopy, or surgery**
      - **BY MOUTH**
        - Child 1 year: 0.25 sachet taken before 8 a.m, then 0.25 sachet after 6–8 hours
        - Child 2-3 years: 0.5 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
        - Child 4-8 years: 1 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
        - Child 9-17 years: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

  - **PHARMACOKINETICS** Acts within 3 hours of first dose.

- **CONTRA-INDICATIONS** Acute severe colitis • ascites • congestive cardiac failure • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • gastro-intestinal ulceration • toxic megacolon
- **CAUTIONS** Cardiac disease (avoid in congestive cardiac failure) • children • colitis (avoid if acute severe colitis) • debilitated patients • fluid and electrolyte disturbances • hypovolaemia (should be corrected before administration) • impaired gag reflex or possibility of regurgitation or aspiration • recent gastro-intestinal surgery
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distention • abdominal pain (usually transient—reduced by taking more slowly) • nausea • vomiting
  - **Uncommon** Dehydration • dizziness • electrolyte disturbances • headache
  - **Frequency not known** Anal discomfort • fatigue • rash • sleep disturbances
  - **PREGNANCY** Caution.
  - **BREAST FEEDING** Caution.
  - **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
  - **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.
- **DIRECTIONS FOR ADMINISTRATION** One sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.
- **PICOLAX® SACHETS** One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.
- **PICOLAX® SACHETS** One reconstituted sachet contains K+ 5 mmol and Mg2+ 87 mmol.
- **PATIENT AND CARER ADVICE** Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients or carers should be given advice on how to administer sodium picosulfate with magnesium citrate oral powder.
- **PICOLAX® SACHETS** Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment.
Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

**CAUTIONARY AND ADVISORY LABELS 10, 13**

**ELECTROLYTES:** May contain Magnesium, potassium

- Picolax (Ferring Pharmaceuticals Ltd)
- Sodium picosulphate 10 mg, Magnesium oxide 3.5 gram, Citric acid anhydrous 12 gram Picolax oral powder 16.1g sachets sugar-free | 20 sachet [PM] no price available

## 2.2 Constipation

### Constipation

#### Description of condition

Constipation is defaecation that is unsatisfactory because of infrequent stools, difficult stool passage, or seemingly incomplete defaecation. It can occur at any age and is common in childhood.

#### Overview

Before prescribing laxatives it is important to be sure that the child is constipated and that the constipation is not secondary to an underlying undiagnosed complaint. Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic. In children with secondary constipation caused by a drug, the drug should be reviewed.

### Laxatives

**Bulk-forming laxatives**

Bulk-forming laxatives include bran, ispaghula husk p. 39, methylcellulose p. 39 and sterculia p. 40. They are of particular value in children with small hard stools if fibre cannot be increased in the diet. They relieve constipation by increasing faecal mass, which stimulates peristalsis; children and their carers should be advised that the full effect may take some days to develop. Adequate fluid intake must be maintained to avoid intestinal obstruction, though this may be difficult for children.

Methylcellulose, ispaghula husk and sterculia may be used in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

**Stimulant laxative**

Stimulant laxatives include bisacodyl p. 44, sodium picosulphate p. 46, and members of the anthraquinone group, senna p. 45, co-danthramer p. 44 and co-danthrusate p. 45. Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction.

The use of co-danthramer and co-danthrusate is limited to constipation in terminally ill patients because of potential carcinogenicity (based on animal studies) and evidence of genotoxicity.

Docusate sodium p. 43 is believed to act as both a stimulant laxative and as a faecal softener (below). Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

**Faecal softeners**

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium, and glycerol suppositories p. 45 have softening properties. Enemas containing arachis oil p. 43 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin has also been used as a lubricant for the passage of stool but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipid pneumonia on aspiration.

**Osmotic laxatives**

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 40 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrocol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 41) are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Macrogols are an effective non-traumatic means of evacuation in children with faecal impaction and can be used in the long-term management of chronic constipation.

#### Bowel cleansing preparations

Bowel cleansing preparations are used before colon surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents; examples include macrocol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride p. 36, citric acid with magnesium carbonate p. 36, magnesium citrate with sodium picosulphate p. 37 and sodium acid phosphate with sodium phosphate p. 42. Bowel cleansing preparations are not treatments for constipation.

#### Management

The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain fruits, vegetables, high-fibre bread, baked beans and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is not recommended.

If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrocol (such as macrocol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

#### Faecal impaction

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrocol (such as macrocol 3350 with potassium chloride, sodium bicarbonate and sodium
chlordiazepoxide) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

Suppositories and enemas should not be used in primary care unless all oral medications have failed and preferably only then following specialist advice. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate p. 43 enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A sodium acid phosphate with sodium phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid. Children undergoing disimpaction should be reviewed within one week. Maintenance treatment should be started as soon as the bowel is disimpacted.

LAXATIVES > BULK-FORMING LAXATIVES

Ispaghula husk 24-Feb-2016

● DRUG ACTION Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

● INDICATIONS AND DOSE
  Conspitation
  ➸ BY MOUTH
  ➸ Child 1 month–5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
  ➸ Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
  ➸ Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening
  DOSE EQUIVALENCE AND CONVERSION
  ➸ 1 sachet equivalent to 2 level 5 mL spoonsful.

● CONTRA-INDICATIONS Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility
● CAUTIONS Adequate fluid intake should be maintained to avoid intestinal obstruction
● SIDE-EFFECTS Abdominal distension · flatulence · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity
● DIRECTIONS FOR ADMINISTRATION Dose to be taken with at least 150 mL liquid.
● PRESCRIBING AND DISPENSING INFORMATION Flavours of soluble granules formulations may include plain, lemon, or orange.
● HANDLING AND STORAGE Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

● PATIENT AND CARER ADVICE Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

– Effervescent granules
  CAUTIONARY AND ADVISORY LABELS 13
  EXCIPIENTS: May contain Aspartame
  ➸ Ispaghula husk (Non-proprietary)
  Ispaghula husk 3.5 gram Ispaghula husk 3.5g effervescent granules sachets gluten free sugar free sugar-free | 30 sachet [P] no price available DT price = £ 2.72

Methylcellulose

● DRUG ACTION Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

● INDICATIONS AND DOSE
  Constipation | Diarrhoea
  ➸ BY MOUTH USING TABLETS
  ➸ Child 7–11 years: 2 tablets twice daily
  ➸ Child 12–17 years: 3–6 tablets twice daily

● UNLICENSED USE No age limit specified by manufacturer.
● CONTRA-INDICATIONS Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction
● CAUTIONS Adequate fluid intake should be maintained to avoid intestinal obstruction
● SIDE-EFFECTS Abdominal distension (especially during the first few days of treatment) · flatulence (especially during the first few days of treatment) · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity
● DIRECTIONS FOR ADMINISTRATION In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

## Lactulose

- **INDICATIONS AND DOSE**
  - **Constipation**
    - **BY MOUTH**
      - Child 6–11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5–mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals
      - Child 12–17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5–mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals
  - **CAUTIONS**
    - Adequate fluid intake should be maintained to avoid intestinal obstruction
  - **SIDE-EFFECTS**
    - Abdominal distension (especially during the first few days of treatment) - flatulence (especially during the first few days of treatment) - gastrointestinal impaction - gastrointestinal obstruction - hypersensitivity
  - **DIRECTIONS FOR ADMINISTRATION**
    - May be mixed with soft food (e.g. yoghurt) before swallowing, followed by plenty of liquid.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Lactulose (Non-proprietary)**
  - Lactulose 666.667 mg per 1 ml Lactulose 10g/15ml oral solution 15ml sachets sugar free sugar-free | 10 sachet [P] £2.50 DT price = £2.50
  - Lactulose 680 mg per 1 ml Lactulose 3.1-3.7g/5ml oral solution | 300 ml [P] £2.73 | 500 ml [P] £4.55 DT price = £4.52
**Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride**

**INDICATIONS AND DOSE**

**Chronic constipation (dose for non-proprietary ‘full-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction (dose for non-proprietary ‘full-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**MOVICOL-HALF®**

**Chronic constipation**
- **BY MOUTH**
  - Child 12-17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

**Faecal impaction**
- **BY MOUTH**
  - Child 12-17 years: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day

**MOVICOL-PAEDIATRIC®**

**Chronic constipation | Prevention of faecal impaction**
- **BY MOUTH**
  - Child 1-11 months: 0.5–1 sachet daily
  - Child 1 year: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
  - Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
  - Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

**Faecal impaction**
- **BY MOUTH**
  - Child 1-11 months: 0.5–1 sachet daily
  - Child 1-4 years: Initially 2 sachets daily on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy
  - Child 5-11 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

**MOVICOL® LIQUID**

**Chronic constipation**
- **BY MOUTH**
  - Child 12-17 years: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day

**FAECAL IMPACTION**

**Chronic constipation**
- **BY MOUTH**
  - Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**
- **BY MOUTH**
  - Child 12-17 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**UNLICENSED USE**

**MOVICOL-PAEDIATRIC®** Movicol® Paediatric not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years.

**CONTRA-INDICATIONS**
- Crohn’s disease · intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract · toxic megacolon · ulcerative colitis

**MOVICOL-PAEDIATRIC®** Cardiovascular impairment · renal impairment

**CAUTIONS**
- Cardiovascular impairment (should not take more than 2 ‘full-strength’ sachets or 4 ‘half-strength’ sachets in any one hour) · discontinue if symptoms of fluid and electrolyte disturbance

**MOVICOL-PAEDIATRIC®** Impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

**SIDE-EFFECTS**
- Abdominal distension · abdominal pain · flatulence · nausea

**PREGNANCY**
- Limited data, but manufacturer advises that it can be used.

**BREAST FEEDING**
- Manufacturer advises that it can be used.

**RENAL IMPAIRMENT**

**MOVICOL-PAEDIATRIC®** Contra-indicated in renal impairment.

**DIRECTIONS FOR ADMINISTRATION**
- Contents of each ‘full strength’ sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL® LIQUID** 25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

**MOVICOL-PAEDIATRIC®** Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

**MOVICOL® ORAL POWDER** Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL-HALF®** Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include orange.
- Flavours of oral powder formulations may include chocolate, lime and lemon, or plain.

**MOVICOL® LIQUID** 25 mL of oral concentrate when diluted with 100 mL water provides K⁺ 5.4 mmol/litre.

**MOVICOL® ORAL POWDER** Amount of potassium chloride varies according to flavour of Movicol® as follows:
plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre.

• **PATIENT AND CARER ADVICE**

Patients or carers should be counselled on how to take the oral powder and oral solution.

**MOVICOL® LIQUID**

Patients or carers should be counselled on how to take Movicol oral solution.

**MOVICOL® ORAL POWDER**

Patients or carers should be counselled on how to take Movicol oral powder.

**MOVICOL-HALF®**

Patients or carers should be given advice on how to administer Movicol-Half® oral powder. Medicines for Children leaflet: Movicol for constipation.

www.medicinesforchildren.org.uk/movicol-for-constipation

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Phillips’ Milk of Magnesia (Omega Pharma Ltd)

Magnesium hydroxide 83 mg per 1 ml

Philips’ Milk of Magnesia

415mg/5ml oral suspension sugar-free | 200 ml GSL £3.22 DT price = £3.22

### Sodium acid phosphate with sodium phosphate

**INDICATIONS AND DOSE**

Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)

- **BY RECTUM**

  - Child 3-6 years: 45–65 mL once daily
  - Child 7-11 years: 65–100 mL once daily
  - Child 12-17 years: 100–128 mL once daily

**FLEET® READY-TO-USE ENEMA**

Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery

- **BY RECTUM**

  - Child 3-6 years: 40–60 mL once daily
  - Child 7-11 years: 60–90 mL once daily
  - Child 12-17 years: 90–118 mL once daily

**CONTRA-INDICATIONS**

Conditions associated with increased colonic absorption - gastro-intestinal obstruction - inflammatory bowel disease

**CAUTIONS**

Ascites - congestive heart failure - electrolyte disturbances - uncontrolled hypertension

**SIDE-EFFECTS**

Electrolyte disturbances - local irritation

**HEPATIC IMPAIRMENT**

Use with caution in cirrhosis.

**RENAL IMPAIRMENT**

Use with caution.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Phillips’ Milk of Magnesia (Omega Pharma Ltd)

Magnesium hydroxide 83 mg per 1 ml

Philips’ Milk of Magnesia

### Magnesium hydroxide

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH**

  - Child 3–11 years: 5–10 mL as required, dose to be given mixed with water at bedtime
  - Child 12–17 years: 10–15 mL as required, dose to be given mixed with water at bedtime

**CONTRA-INDICATIONS**

Acute gastro-intestinal conditions

**INTERACTIONS**

Appendix 1: magnesium

**SIDE-EFFECTS**

Colic

**HEPATIC IMPAIRMENT**

Avoid in hepatic coma if risk of renal failure.

**RENAL IMPAIRMENT**

Avoid or reduce dose. Increased risk of toxicity in renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
**Sodium citrate**

- **INDICATIONS AND DOSE**
  - **MICOLETTE**
    - Constipation
      - **BY RECTUM**
        - Child 3-17 years: 5–10 mL for 1 dose
  - **MICRALAX**
    - Constipation
      - **BY RECTUM**
        - Child 3-17 years: 5 mL for 1 dose
    - **RELAXIT**
      - Constipation
        - **BY RECTUM**
          - Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
          - Child 3-17 years: 5 mL for 1 dose

- **CONTRA-INDICATIONS**
  - Acute gastro-intestinal conditions

- **CAUTIONS**
  - Sodium and water retention in susceptible individuals

- **INTERACTIONS**
  - Appendix 1: sodium citrate

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Enema**
    - Micolette Micro-enema (Pinewood Healthcare)
      - Sodium citrate 90 mg per 1 ml

- **Arachis oil**
  - **INDICATIONS AND DOSE**
    - **To soften impacted faeces**
      - **BY RECTUM**
        - Child 3-6 years (under close medical supervision): 45–65 mL as required
        - Child 7-11 years (under close medical supervision): 65–100 mL as required
        - Child 12-17 years (under close medical supervision): 100–130 mL as required

- **UNLICENSED USE**
  - Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS**
  - Inflammatory bowel disease

- **CAUTIONS**
  - Hypersensitivity to soya / intestinal obstruction

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if history of hypersensitivity to arachis oil or peanuts.

- **DIRECTIONS FOR ADMINISTRATION**
  - Warm enema in warm water before use.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Enema**
    - Arachis oil (Non-proprietary)
      - Arachis oil 1 ml per 1 ml
      - Arachis oil 130ml enema | 1 enema £47.50 DT price = £47.50

---

**Docusate sodium**

- **INDICATIONS AND DOSE**
  - **(Dioctyl sodium sulphasuccinate)**
    - Chronic constipation
      - **BY MOUTH**
        - Child 6 months-1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
        - Child 2-11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
        - Child 12-17 years: Up to 500 mg daily in divided doses, adjusted according to response
      - **BY RECTUM**
        - Child 12-17 years: 120 mg for 1 dose
    - **Adjunct in abdominal radiological procedures**
      - **BY MOUTH**
        - Child 12-17 years: 400 mg, to be administered with barium meal
      - **BY RECTUM**
        - Child 12-17 years: 120 mg for 1 dose

- **PHARMACOKINETICS**
  - Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

- **UNLICENSED USE**
  - Adult oral solution and capsules not licensed for use in children under 12 years.

- **CONTRA-INDICATIONS**
  - Avoid in intestinal obstruction

- **CAUTIONS**
  - Do not give with liquid paraffin

- **SIDE-EFFECTS**
  - Abdominal cramp
  - Rash

- **PREGNANCY**
  - Not known to be harmful—manufacturer advises caution.

- **BREAST FEEDING**
  - With oral use: Present in milk following oral administration—manufacturer advises caution.
  - With rectal use: Rectal administration not known to be harmful.

- **DIRECTIONS FOR ADMINISTRATION**
  - For administration by mouth, solution may be mixed with milk or squash.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Enema**
    - Norgalax (Essential Pharma Ltd)
      - Docusate sodium 12 mg per 1 gram
      - Norgalax 120mg/10g enema | 6 enema £28.00
  - **Capsule**
    - Dioctyl (UCB Pharma Ltd)
      - Docusate sodium 100 mg
      - Dioctyl 100mg capsules | 30 capsule £2.09 DT price = £2.09 | 100 capsule £6.98

  **Combinations available:** Co-danthrusate, p. 45
**Bisacodyl**

### INDICATIONS AND DOSE

**Constipation**
- **By mouth**
  - Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
  - Child 2–17 years: 5–10 mg once daily, adjusted according to response

**Bowel clearance before radiological procedures and surgery**
- Initially by mouth
  - Child 4–9 years: 5 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 5 mg if required, dose to be administered 1 hour before procedure
  - Child 10–17 years: 10 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 10 mg if required, dose to be administered 1 hour before procedure

**PHARMACOKINETICS**
- Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

### CONTRA-INDICATIONS
- Acute abdominal conditions - acute inflammatory bowel disease - intestinal obstruction - severe dehydration

### CAUTIONS
- Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia - risk of electrolyte imbalance with prolonged use

### INTERACTIONS
- Appendix 1: bisacodyl

### SIDE-EFFECTS

**General side-effects**
- Abdominal cramp - colitis - nausea - vomiting

**Specific side-effects**
- With rectal use Local irritation

### PREGNANCY
- May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository, enema

  - Bisacodyl 333.333 microgram per 1 ml: Bisacodyl 10mg/30ml enema | 1 enema P no price available

**Suppository**
- **Bisacodyl (Non-proprietary)**
  - Bisacodyl 10 mg: Bisacodyl 10mg suppositories | 12 suppository P £3.53 DT price = £3.53
  - **Dulco-Lax (bisacodyl)** (Boehringer Ingelheim Self-Medication Division)
    - Bisacodyl 5 mg: DulcoLax 5mg suppositories for children | 5 suppository P £1.04 DT price = £1.04
    - Bisacodyl 10 mg: Dulcolax 10mg suppositories | 12 suppository P £2.35 DT price = £3.53

**Co-danthramer**

### INDICATIONS AND DOSE

**Constipation in terminally ill patients (standard strength capsules)**
- **By mouth using capsules**
  - Child 6–11 years: 1 capsule once daily, dose should be taken at night
  - Child 12–17 years: 1–2 capsules once daily, dose should be taken at night

**Constipation in terminally ill patients (strong capsules)**
- **By mouth using capsules**
  - Child 12–17 years: 1–2 capsules once daily, dose should be taken at night

**Constipation in terminally ill patients (standard strength suspension)**
- **By mouth using oral suspension**
  - Child 12–17 years: 5–10 mL once daily, dose should be taken at night

**Constipation in terminally ill patients (strong suspension)**
- **By mouth using oral suspension**
  - Child 12–17 years: 5 mL once daily, dose should be taken at night

**Dose equivalence and conversion**
- Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer ‘188’ 200 mg per capsule.
- Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer ‘188’ 200 mg per 5 mL.
- Co-danthramer strong capsules contain dantron 37.5 mg with poloxamer ‘188’ 500 mg.
- Co-danthramer strong oral suspension contains dantron 75 mg with poloxamer ‘188’ 1 g per 5 mL.
- Co-danthramer suspension 5 mL = one co-danthramer capsule, but strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

### CONTRA-INDICATIONS
- Acute abdominal conditions - acute inflammatory bowel disease - intestinal obstruction - severe dehydration

### CAUTIONS
- Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia - may cause local irritation - rodent studies indicate potential carcinogenic risk

### CAUTIONS, FURTHER INFORMATION
- Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

### INTERACTIONS
- Appendix 1: dantron

### SIDE-EFFECTS
- Abdominal cramp - urine may be coloured red

### PREGNANCY
- Manufacturers advise avoid—limited information available.

### BREASTFEEDING
- Manufacturers advise avoid—no information available.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- CAUTIONARY AND ADVISORY LABELS 14 (urine red)
  - **Co-danthramer (Non-proprietary)**
    - Dantron 5 mg per 1 ml, Poloxamer 188 40 mg per 1 ml: Co-danthramer 25mg/200mg/Sml oral suspension sugar free sugar-free | 300 ml P P £146.39 DT price = £146.39
    - Dantron 15 mg per 1 ml, Poloxamer 188 200 mg per 1 ml: Co-danthramer 75mg/1000mg/Sml oral suspension sugar free sugar-free | 300 ml P P £293.63 DT price = £293.63

### GLP-1 agonist therapy
**Co-danthrusate**

**INDICATIONS AND DOSE**

**Constipation in terminally ill patients**
- **BY MOUTH USING CAPSULES**
  - Child 6-11 years: 1 capsule once daily, to be taken at night
  - Child 12-17 years: 1–3 capsules once daily, to be taken at night
- **BY MOUTH USING ORAL SUSPENSION**
  - Child 6-11 years: 5 mL once daily, to be taken at night
  - Child 12-17 years: 5–15 mL once daily, to be taken at night

**DOSE EQUIVALENCE AND CONVERSION**
- Co-danthrusate suspension contains dantron 50 mg and docusate 60 mg per 5 mL.
- Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

**CONTRA-INDICATIONS**
- Acute abdominal conditions • acute inflammatory bowel disease • intestinal obstruction • severe dehydration

**CAUTIONS**
- Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia • may cause local irritation • rodent studies indicate potential carcinogenic risk

**CAUTIONS, FURTHER INFORMATION**
- Local irritation • Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

**INTERACTIONS**
- Appendix 1: dantron, docusate sodium

**SIDE-EFFECTS**
- Abdominal cramp • urine may be coloured red

**PREGNANCY**
- Manufacturers advise avoid—limited information available.

**BREAST FEEDING**
- Manufacturers advise avoid—no information available.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Co-danthrusate (Non-proprietary)
      - Dantron 10 mg per 1 mL, Docusate sodium 12 mg per 1 mL
      - Co-danthrusate 50mg/60mg/5ml oral suspension sugar free sugar-free
      - 200 mL [PSM] £89.92 DT price = £89.92
  - **Capsule**
    - Co-danthrusate (Non-proprietary)
      - Dantron 50 mg, Docusate sodium 60 mg
      - Co-danthrusate 50mg/60mg capsules • 63 capsule [PSM] no price available DT price = £52.50

---

**Senna**

**DRUG ACTION**
- Senna is a stimulant laxative. After metabolism of sennosides in the gut the anthrone component stimulates peristalsis thereby increasing the motility of the large intestine.

**INDICATIONS AND DOSE**

**Constipation**
- **BY MOUTH USING TABLETS**
  - Child 2-3 years: 3.75–15 mg once daily, adjusted according to response
  - Child 4-5 years: 3.75–30 mg once daily, adjusted according to response
  - Child 6-17 years: 7.5–30 mg once daily, adjusted according to response
- **BY MOUTH USING SYRUP**
  - Child 1 month-3 years: 3.75–15 mg once daily, adjusted according to response
  - Child 4-17 years: 7.5–30 mg once daily, adjusted according to response

**PHARMACOKINETICS**
- Onset of action 8–12 hours.

**UNLICENSED USE**
- Tablets not licensed for use in children under 6 years. **Syrup** not licensed for use in children under 2 years. Doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

**CONTRA-INDICATIONS**
- Intestinal obstruction • undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: senna

**SIDE-EFFECTS**
- Abdominal spasm • discoloration of urine • pruritus

**SIDE-EFFECTS, FURTHER INFORMATION**
- Prolonged or excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia.

**PREGNANCY**
- Specialist sources indicate suitable for use in pregnancy.

**BREAST FEEDING**
- Specialist sources indicate suitable for use in breast-feeding in infants over 1 month.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Senna for constipation www.medicinesforchildren.org.uk/senna-for-constipation

**NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions Senokot® tablets.

**EXCEPTIONS TO LEGAL CATEGORY**
- Senna is on sale to the public for use in children over 12 years; doses on packs may vary from those in BNF Publications.

---

**Glycerol**

**(Glycerin)**

**INDICATIONS AND DOSE**

**Constipation**
- **BY RECTUM**
  - Child 1-11 months: 1 g as required
  - Child 1-11 years: 2 g as required
  - Child 12-17 years: 4 g as required

**INTERACTIONS**
- Appendix 1: glycerol

**DIRECTIONS FOR ADMINISTRATION**
- Moisten suppositories with water before insertion.

**PRESCRIBING AND DISPENSING INFORMATION**
- When prepared extemporaneously, the BP states Glycerol

**Co-danthrusate**

**Suppositories**, BP consists of gelatin 140 mg, glycerol 700 mg, purified water to 1 g.

**Patient and Carer Advice**
- Medicines for Children leaflet: Glycerin (glycerol) suppositories for constipation www.medicinesforchildren.org.uk/glycerin-glycerol-suppositories-for-constipation

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository

**Suppository**
- Glycerin (Non-proprietary)
  - Gelatin 140 mg per 1 gram, Glycerol 700 mg per 1 gram
  - Glycerol 2g suppositories $1.20 D price = $1.67
  - Glycerol 1g suppositories $1.20 D price = $1.04
  - Glycerol 4g suppositories $1.20 D price = $1.16

---
Senna with ispaghula husk

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna p. 45, ispaghula husk p. 39.

- **INDICATIONS AND DOSE**

  **Constipation**
  - BY MOUTH
    - Child 12-17 years: 5–10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules

- **INTERACTIONS** → Appendix 1: senna

- **SIDE-EFFECTS** Urine coloured yellow or red-brown

- **PREGNANCY** Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.

- **DIRECTIONS FOR ADMINISTRATION** Take at night with at least 150 ml liquid...

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Granules**

  **CONDITIONS AND ADVISORY LABELS** 25

  **EXCIPIENTS:** May contain Sucrose

  * Manevac (Media Pharmaceuticals Ltd)
    * Senna fruit 124 mg per 1 gram, Ispaghula 542 mg per 1 gram Manevac granules | 400 gram | £9.50 DT price = £9.50

Sodium picosulfate

(Sodium picosulphate)

- **DRUG ACTION** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

- **INDICATIONS AND DOSE**

  **Constipation**
  - BY MOUTH
    - Child 1 month–3 years: 2.5–10 mg once daily, adjusted according to response
    - Child 4–17 years: 2.5–20 mg once daily, adjusted according to response

  **PHARMACOKINETICS**

  Onset of action 6–12 hours.

- **UNLICENSED USE** Doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

- **CONTRA-INDICATIONS** Intestinal obstruction · undiagnosed abdominal pain

- **INTERACTIONS** → Appendix 1: sodium picosulfate

- **SIDE-EFFECTS**

  - Common or very common Abdominal cramp
  - Uncommon Dizziness · nausea · vomiting
  - Frequency not known Angioedema · pruritus · rash · syncope

  **SIDE-EFFECTS, FURTHER INFORMATION**

  Prolonged or excessive use can cause diarrhoea and related effects such as hypokalaemia.

  **PREGNANCY** Manufacturer states evidence limited but not known to be harmful.

  **BREAST FEEDING** [E]rKat Specialist sources indicate suitable for use in breast-feeding in infants over 1 month—not known to be present in milk. [D]

  **PATIENT AND CARER ADVICE**

3 Diarrhoea

Acute diarrhoea

Management of acute diarrhoea

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion—this is particularly important in infants. Oral rehydration preparations are used in the prevention or reversal of fluid and electrolyte depletion. Severe dehydration requires immediate admission to hospital and urgent replacement of fluid and electrolytes.

AdSORBents and bulk-forming drugs

Adsorbents such as kaolin are not recommended for acute diarrhoea. Bulk-forming drugs, such as ispaghula husk p. 39, methylcellulose p. 39, and sterculia p. 40 are rarely effective in controlling faecal consistency in ileostomy and colostomy.

Colestyramine p. 125 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

Antibacterial drugs

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without such treatment, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment.
Antimotility drugs
Antimotility drugs relieve symptoms of diarrhoea. They prolong the duration of intestinal transit by binding to opioid receptors in the gastro-intestinal tract. Loperamide hydrochloride below is used due to its action on opioid receptors in the gastrointestinal tract and because it does not cross the blood–brain barrier readily. Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in children under 12 years.

Antimotility drugs have a role in Inflammatory bowel disease p. 24 and are also used in Stoma care p. 72.

Antispasmodics
Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis since they are rarely effective and have troublesome side-effects.

Enkephalinase inhibitors
Racemadotril p. 48 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racemadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racemadotril does not affect the duration of intestinal transit.

Other drugs used for Diarrhoea Codeine phosphate, p. 265

### Loperamide hydrochloride

#### INDICATIONS AND DOSE

**Symptomatic treatment of acute diarrhoea**

- **BY MOUTH**
  - Child 2–3 years: 0.5 tablet 3 times a day
  - Child 4–8 years: 1 tablet 3 times a day
  - Child 9–11 years: 1 tablet 4 times a day
  - Child 12–15 years: 2 tablets 3 times a day
  - Child 16–17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

**Control of faecal consistency after colostomy or ileostomy**

- **BY MOUTH**
  - Child 2–3 years: 0.5 tablet 3 times a day
  - Child 4–8 years: 1 tablet 3 times a day
  - Child 9–11 years: 1 tablet 4 times a day
  - Child 12–15 years: 2 tablets 3 times a day
  - Child 16–17 years: Initially 4 tablets, then 2 tablets 4 times a day

**Chronic diarrhoea**

- **BY MOUTH**
  - Child 1–11 months: 100–200 micrograms/kg twice daily, to be given 30 minutes before feeds; increased if necessary up to 2 mg/kg daily in divided doses
  - Child 1–11 years: 100–200 micrograms/kg 3–4 times a day (max. per dose 2 mg), increased if necessary up to 1.25 mg/kg daily in divided doses; maximum 16 mg per day
  - Child 12–17 years: 2–4 mg 2–4 times a day; maximum 16 mg per day

#### UNLICENSED USE

- Not licensed for use in children under 4 years.

#### CONTRA-INDICATIONS

- Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

#### CAUTIONS

- Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage; young children are particularly susceptible to overdose; symptoms may be delayed and observation is needed for at least 48 hours after ingestion

#### INTERACTIONS

- Appendix 1: atropine, opioids

#### SIDE-EFFECTS

- Very rare Angle-closure glaucoma

**Abdominal pain - anorexia - constipation - dilation of the pupils with loss of accommodation - dry mouth - dryness of the skin - fever - flushing - giddiness - nausea - photophobia - reduced bronchial secretions - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency - vomiting**

- **PREGNANCY** Manufacturer advises caution.

- **BREAST FEEDING** May be present in milk.

- **HEPATIC IMPAIRMENT** Avoid in jaundice.

#### DIRECTIONS FOR ADMINISTRATION

- For administration by mouth tablets may be crushed.

#### PRESCRIBING AND DISPENSING INFORMATION

- A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.

#### EXCEPTIONS TO LEGAL CATEGORY

- Co-phenotrope 2.5/0.025 can be sold to the public for children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Co-phenotrope (Non-proprietary)
    - Atropine sulphate 25 microgram, Diphenoxylate hydrochloride 2.5 mg Lomatil 2.5mg/25microgram tablets | 100 tablet (PPE) no price available (CR)

### Other drugs used for diarrhoea

- Codeine phosphate, p. 265
Loperamide with simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride p. 47, simeticone p. 51.

**INDICATIONS AND DOSE**

**Acute diarrhoea with abdominal colic**

*BY MOUTH*

- Child 12–17 years: Initially 1 tablet, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day

**INTERACTIONS** → Appendix 1: loperamide

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

*Tablet*

- **Imodium Plus** (McNeil Products Ltd)
  - Loperamide hydrochloride 2 mg, Dimeticone (as Simeticone)
  - 125 mg Imodium Plus caplets | 12 tablet £3.66

**ANTI-DIARRHOEALS > ENKEPHALINASE INHIBITORS**

**Racecadotril**

11-Feb-2016

**INDICATIONS AND DOSE**

Adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea

*BY MOUTH USING GRANULES*

- Child 3 months–17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 9–12 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 13–27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days

**CONTRA-INDICATIONS**

Antibiotic-associated diarrhoea

**SIDE-EFFECTS**

- Uncommon Erythema · rash
- Frequency not known Angioedema · pruritus · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- Skin reactions Severe skin reactions have been reported—discontinue treatment immediately.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **DIRECTIONS FOR ADMINISTRATION**
  - Granules may be added to food or mixed with water or bottle feeds and then taken immediately.
- **PATIENT AND CARER ADVICE**
  - Patients and carers should be given advice on how to administer racecadotril granules.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Granules**

- **EXCIPIENTS:** May contain Sucrose
- **Hidrasec** (Lincoln Medical Ltd)
  - **Racecadotril 10 mg** Hidrasec Infants 10mg granules sachets | 20 sachet £8.42
  - **Racecadotril 30 mg** Hidrasec Children 30mg granules sachets | 20 sachet £8.42
4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

Overview

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration, gastro-oesophageal reflux disease, gastritis, and upper gastro-intestinal motility disorders, but most commonly it is of uncertain origin.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

A compound alginate preparation may provide relief from dyspepsia; persistent dyspepsia requires investigation. Treatment with a \( \text{H}_2 \)-receptor antagonist or a proton pump inhibitor should be initiated only on the advice of a hospital specialist.

*Helicobacter pylori* may be present in children with dyspepsia. *H. pylori* eradication therapy should be considered for persistent dyspepsia if it is ulcer-like. However, most children with functional (investigated, non-ulcer) dyspepsia do not benefit symptomatically from *H. pylori* eradication.

ANTACIDS › ALGINATE

**Alginic acid**

- **INDICATIONS AND DOSE**
  - **GAVISCON INFANT® POWDER SACHETS**
    - Management of gastro-oesophageal reflux disease
      - **BY MOUTH**
        - Neonate (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day.
        - Neonate (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day.
        - Child 1–23 months (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day.
        - Child 1–23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day
  - **CONTRA-INDICATIONS** Intestinal obstruction · preterm neonates · where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)
  - **GAVISCON INFANT® POWDER SACHETS** Concurrent use of preparations containing thickening agents
  - **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
  - **RENAL IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium.
  - **PRESCRIBING AND DISPENSING INFORMATION** Each half of the dual-sachet is identified as ‘one dose’. To avoid errors prescribe with directions in terms of ‘dose’.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
    - **Powder**
      - **ELECTROLYTES:** May contain Sodium
      - **Gaviscon Infant** (Forum Health Products Ltd)
        - Magnesium alginate 87.5 mg, Sodium alginate 225 mg
        - Gaviscon Infant oral powder sachets sugar-free 15 dual dose sachet
        - £4.82 DT price + £4.82

**Sodium alginate with potassium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid above.

- **INDICATIONS AND DOSE**
  - **Management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease**
    - **BY MOUTH USING CHEWABLE TABLETS**
      - Child 6–11 years (under medical advice only): 1 tablet, to be chewed after meals and at bedtime
Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 572, magnesium hydroxide p. 42.

**INDICATIONS AND DOSE**

**MAALOX**

**Dyspepsia**

- **BY MOUTH**
  - Child 14–17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required

**MUCOGEL**

**Dyspepsia**

- **BY MOUTH**
  - Child 12–17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required

**INTERACTIONS** → Appendix 1: antacids

**PRESCRIBING AND DISPENSING INFORMATION** Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

**MUCOGEL** Mucogel® suspension is low in sodium.

**MAALOX** Maalox® suspension is low in sodium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Maalox**
  - **Sodium alginate** 100 mg per 1 ml
  - **Magnesium hydroxide** 39 mg per 1 ml
  - **Aluminium hydroxide** gel dried 44 mg per 1 ml

**CONTRA-INDICATIONS** Hypophosphataemia

**SIDE-EFFECTS**

- Constipation and diarrhoea
  - Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION** Altacite Plus® is low in Na⁺.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Altacite Plus**
  - **Simeticone** 25 mg per 1 ml
  - **Hydrotalcite** 100 mg per 1 ml

**CONTRA-INDICATIONS** Hypophosphataemia

**SIDE-EFFECTS**

- Constipation and diarrhoea

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION** Altacite Plus® is low in Na⁺.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Mucogel**
  - **Magnesium hydroxide** 39 mg per 1 ml
  - **Aluminium hydroxide** dried 44 mg per 1 ml

**CONTRA-INDICATIONS** Hypophosphataemia

**SIDE-EFFECTS**

- Constipation and diarrhoea

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION** Mucogel® suspension is low in sodium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Maalox**
  - **Magnesium hydroxide** 39 mg per 1 ml
  - **Aluminium hydroxide** dried 44 mg per 1 ml

**CONTRA-INDICATIONS** Hypophosphataemia

**SIDE-EFFECTS**

- Constipation and diarrhoea

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION** Maalox® suspension is low in sodium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Maalox**
  - **Magnesium hydroxide** 39 mg per 1 ml
  - **Aluminium hydroxide** dried 44 mg per 1 ml

**CONTRA-INDICATIONS** Hypophosphataemia

**SIDE-EFFECTS**

- Constipation and diarrhoea

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

Simeticone with aluminium hydroxide and magnesium hydroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone below, aluminium hydroxide p. 572.

**INDICATIONS AND DOSE**

**Dyspepsia**
- **By mouth**
  - Child 5–11 years: 5–10 mL 3 times a day
  - Child 12–17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water

**INTERACTIONS** ➔ Appendix 1: antacids

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary)
  - 50 mg per 1 mL, Sodium bicarbonate 50 mg per 1 mL
  - Magnesium trisilicate oral suspension | 200 mL [G35] £1.65 DT price = £1.65

**ANTIFOAMING DRUGS**

Simeticone
(Activated dimeticone)

**DRUG ACTION** Simeticone (activated dimeticone) is an antifoaming agent.

**INDICATIONS AND DOSE**

**Dentinox**
- **Colic/Wind pains**
  - **By mouth**
  - Neonate: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day.
  - Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day

**Infacol**
- **Colic/Wind pains**
  - **By mouth**
  - Neonate: 0.5–1 mL, to be taken before feeds.
  - Child 1 month–1 year: 0.5–1 mL, to be taken before feeds

**PRESCRIBING AND DISPENSING INFORMATION**

**Dentinox** The brand name Dentinox® is also used for other preparations including teething gel.

**PATIENT AND CARER ADVICE**

**Infacol** Patients or carers should be given advice on use of the Infacol® dropper.

**LESS SUITABLE FOR PRESCRIBING**

**Infacol** Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**Dentinox** Dentino® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- Infacol (Teva UK Ltd)
  - Simeticone 40 mg per 1 mL Infacol 40 mg/mL oral suspension sugar-free | 50 ml [G35] £2.71 DT price = £2.71

**Oral drops**
- Dentinox Infant (Dendron Ltd)
  - Simeticone 8.4 mg per 1 mL Dentinox Infant colic drops | 100 ml [G35] £1.73

Combinations available: Co-simalcite, p. 50 - Simeticone with aluminium hydroxide and magnesium hydroxide, above
4.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces the recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of H. pylori should be confirmed before starting eradication treatment. If possible, the antibacterial sensitivity of the organism should be established at the time of endoscopy and biopsy. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

Treatment to eradicate H. pylori infection in children should be initiated under specialist supervision. One week triple-therapy regimens that comprise omeprazole p. 57, amoxicillin p. 325, and either clarithromycin p. 315 or metronidazole p. 319 are recommended, see p. 53. Resistance to clarithromycin or to metronidazole is much more common than to amoxicillin and can develop during treatment. A regimen containing amoxicillin and clarithromycin is therefore recommended for initial therapy and one containing amoxicillin and metronidazole is recommended for eradication failure or for a child who has been treated with a macrolide for other infections. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist); however, if the ulcer is large, or complicated by haemorrhage or perforation then antisecretory treatment is continued for a further 3 weeks. Lansoprazole p. 56 may be considered if omeprazole is unsuitable. Treatment failure usually indicates antibacterial resistance or poor compliance.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial produce low rates of H. pylori eradication and are not recommended.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in children starting or taking NSAIDs.

Test for Helicobacter pylori

¹³C-Urea breath test kits are available for confirming the presence of gastro-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-Urea breath test kit for children is available (Helicobacter Test INFAl for children of the age 3–11 ®). However the appropriateness of testing for H. pylori infection in children has not been established. Breath, salivary, faecal, and urine tests for H. pylori are frequently unreliable in children; the most accurate method of diagnosis is endoscopy with biopsy.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. Whenever possible, NSAIDs should be withdrawn if an ulcer occurs.

Children at high risk of developing gastro-intestinal complications with a NSAID include those with a history of peptic ulcer disease or serious upper gastro-intestinal complication, those taking other medicines that increase the risk of upper gastro-intestinal side-effects, or those with serious co-morbidity. In children at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; high dose ranitidine p. 53 is an alternative.

NSAID use and H. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In children already taking a NSAID, eradication of H. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in children about to start long-term NSAID treatment who are H. pylori positive and have dyspepsia or a history of gastric or duodenal ulcer, eradication of H. pylori may reduce the overall risk of ulceration.

If the NSAID can be discontinued in a child who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing; alternatively the ulcer can be treated with an H₂-receptor antagonist.

If NSAID treatment needs to continue, the ulcer is treated with a proton pump inhibitor.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Sucralfate

Sucralfate below is a complex of aluminium hydroxide and sulfated sucrose that appears to act by protecting the mucosa from acid-pepsin attack; it has minimal antacid properties.

Sucralfate

● INDICATIONS AND DOSE

Benign gastric ulceration | Benign duodenal ulceration

▶ BY MOUTH

Child 1 month–1 year: 250 mg 4–6 times a day

Child 2–11 years: 500 mg 4–6 times a day

Child 12–14 years: 1 g 4–6 times a day

Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Prophylaxis of stress ulceration in child under intensive care

▶ BY MOUTH

Child 1 month–1 year: 250 mg 4–6 times a day

Child 2–11 years: 500 mg 4–6 times a day

Child 12–14 years: 1 g 4–6 times a day

Child 15–17 years: 1 g 6 times a day; maximum 8 g per day

● UNLICENSED USE Not licensed for use in children under 15 years. Tablets not licensed for prophylaxis of stress ulceration.

● CAUTIONS Patients under intensive care (Important: reports of bezoar formation)
Recommended regimens for *Helicobacter pylori* eradication

**CAUTIONS, FURTHER INFORMATION**
- Bezoar formation  Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.
- **INTERACTIONS**  → Appendix 1: sucralfate
- **SIDE-EFFECTS**
  - **Common or very common**  Constipation
  - **Uncommon**  Back pain, bezoar formation, diarrhoea, dizziness, drowsiness, dry mouth, headache, flatulence, gastric discomfort, indigestion, nausea, rash
- **PREGNANCY**  No evidence of harm; absorption from gastrointestinal tract negligible.
- **BREAST FEEDING**  Amount probably too small to be harmful.
- **RENAI IMPAIRMENT**  Use with caution; aluminium is absorbed and may accumulate.
- **DIRECTIONS FOR ADMINISTRATION**  Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by mouth, sucralfate should be given 1 hour before meals. Oral suspension blocks fine-bore feeding tubes. Crushed tablets may be dispersed in water.
- **PRESCRIBING AND DISPENSING INFORMATION**  Flavours of oral liquid formulations may include aniseed and caramel.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

### H₂-receptor antagonists

#### H₂-receptor antagonists

**Overview**
Histamine H₂-receptor antagonists heal *gastric* and *duodenal ulcers* by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of *dyspepsia* and *gastro-oesophageal reflux disease*. H₂-receptor antagonists should not normally be used for *Zollinger–Ellison syndrome* because proton pump inhibitors are more effective.

Maintenance treatment with low doses has largely been replaced in *Helicobacter pylori* positive children by eradication regimens. H₂-receptor antagonist therapy can promote healing of *NSAID*-associated ulcers.

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melena, but prophylactic use reduces the frequency of bleeding from *gastro-duodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. Treatment also reduces the risk of *acid aspiration* in obstetric patients at delivery (Mendelson’s syndrome).

H₂-receptor antagonists are also used to reduce the degradation of pancreatic enzyme supplements in children with cystic fibrosis.

#### H₂-receptor antagonists

- **SIDE-EFFECTS**
  - **Common or very common**  Diarrhoea, dizziness, headache
  - **Uncommon**  Erythema multiforme, rash, toxic epidermal necrolysis
  - **Rare**  Arthralgia, blood disorders, bradycardia, cholestatic jaundice, confusion, depression, hallucinations, hepatitis, leucopenia, myalgia, pancytopenia, psychiatric reactions, thrombocytopenia
  - **Frequency not known**  Gynaecomastia, impotence

**SIDE-EFFECTS, FURTHER INFORMATION**
- Psychiatric reactions  Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the very ill.

#### Ranitidine

- **INDICATIONS AND DOSE**
  - **Benign gastric ulceration | Duodenal ulceration**
  - **BY MOUTH**
    - **Neonate:** 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.
    - **Child 1–5 months:** 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
    - **Child 6 months–2 years:** 2–4 mg/kg twice daily
    - **Child 3–11 years:** 2–4 mg/kg twice daily (max. per dose 150 mg)
    - **Child 12–17 years:** 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night

continued →
Prophylaxis of stress ulceration

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**

- **Neonate:** 0.5–1 mg/kg every 6–8 hours.

- **Child**
  - Aged 1 month–11 years: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour
  - Aged 12–17 years: 50 mg every 8 hours, doses to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

**Reflux oesophagitis and other conditions where gastric acid reduction is beneficial**

- **BY MOUTH**

  - **Neonate:** 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral dosage is unreliable.

  - **Child:**
    - Aged 1 month–11 years: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
    - Aged 6 months–2 years: 2–4 mg/kg twice daily
    - Aged 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease

- **Child**
  - Aged 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

- **BY SLOW INTRAVENOUS INJECTION**

- **Neonate:** 0.5–1 mg/kg every 6–8 hours.

- **Child:** 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour

**Undiluted Use** Oral preparations not licensed for use in children under 3 years. *Injection* not licensed for use in children in under 6 months.

**INTERACTIONS** → Appendix 1: H₂ receptor antagonists

**SIDE-EFFECTS**

- **Uncommon**
  - Blurred vision

- **Frequency not known**
  - Alopecia • interstitial nephritis • involuntary movement disorders • pancreatitis

**PREGNANCY**

- Manufacturer advises avoid unless essential, but not known to be harmful.

**BREAST FEEDING**

- Significant amount present in milk, but not known to be harmful.

**RENAL IMPAIRMENT**

- Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For slow intravenous injection dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.

**PATIENT AND CARER ADVICE**

- In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.

- Medicines for Children leaflet: Ranitidine for acid reflux
  - www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux

**EXCEPTIONS TO LEGAL CATEGORY**

- Ranitidine can be sold to the public for children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

### Tablet

- **Ranitidine (Non-proprietary)**

### Solution for injection

- **Ranitidine (Non-proprietary)**

  - **Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml**
    - Ranitidine 50 mg/2 ml solution for injection ampoules | 5 ampoule | £2.69–£5.00 DT price = £2.69

- **Zantac** (GlaxoSmithKline UK Ltd)

  - **Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml**
    - Zantac 50 mg/2 ml solution for injection ampoules | 5 ampoule | £2.82 DT price = £2.69

### Effervescent tablet

- CAUTIONARY AND ADVISORY LABELS 13

- **ELECTROLYTES**: May contain Sodium

- **Ranitidine (Non-proprietary)**

  - **Ranitidine (as Ranitidine hydrochloride) 150 mg**
    - Ranitine 150 mg effervescent tablets | 60 tablet | £35.00 DT price = £34.93
  
  - **Ranitidine (as Ranitidine hydrochloride) 300 mg**
    - Ranitine 300 mg effervescent tablets | 30 tablet | £35.00 DT price = £34.93

### Oral solution

- **EXCIPIENTS**: May contain Alcohol

- **Ranitidine (Non-proprietary)**

  - **Ranitidine (as Ranitidine hydrochloride) 15 mg per 1 ml**
    - Ranitidine 75 mg/5 mL oral solution sugar-free | 100 ml | £2.07–£2.64 sugar-free | 300 ml | £1.55 DT price = £1.26

- **Zantac** (GlaxoSmithKline UK Ltd)

  - **Ranitidine (as Ranitidine hydrochloride) 15 mg per 1 ml**
    - Zantac 150 mg/10 ml syrup sugar-free | 300 ml | £20.76 DT price = £16.26

### Proton pump inhibitors

#### Overview

Omeprazole p. 57 is an effective short-term treatment for gastric and duodenal ulcers; it is also used in combination with antibiotics for the eradication of Helicobacter pylori. An initial short course of omeprazole is the treatment of choice in gastro-oesophageal reflux disease with severe symptoms; children with endoscopically confirmed erosive, ulcerative, or stricturet oesophagitis usually need to be maintained on omeprazole.

Omeprazole is also used for the prevention and treatment of NSAID-associated ulcers. In children who need to continue NSAID treatment after an ulcer has healed, the dose of omeprazole should not normally be reduced because asymptomatic ulcer deterioration may occur.

Omeprazole is effective in the treatment of the Zollinger-Ellison syndrome (including cases resistant to other treatment). It is also used to reduce the degradation of pancreatic enzyme supplements in children with cystic fibrosis.
Proton pump inhibitors

**DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen–potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

**INDICATIONS AND DOSE**

<|endoftext|>
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

### Gastro-resistant capsule
- **Esomeprazole (Non-proprietary)**
  - Esomeprazole (as Esomeprazole magnesium dihydrate)
    - **20 mg** Esomeprazole 20mg gastro-resistant capsules | 28 capsule [Pom] £12.95 DT price = £2.64
  - **40 mg** Esomeprazole 40mg gastro-resistant capsules | 28 capsule [Pom] £17.63 DT price = £3.30
- **Emozul (Consilient Health Ltd)**
  - Esomeprazole (as Esomeprazole magnesium dihydrate)
    - **20 mg** Emozul 20mg gastro-resistant capsules | 28 capsule [Pom] £2.64 DT price = £2.64
  - **40 mg** Emozul 40mg gastro-resistant capsules | 28 capsule [Pom] £3.30 DT price = £3.30
- **Ventra (Ethypharm UK Ltd)**
  - Esomeprazole (as Esomeprazole magnesium dihydrate)
    - **20 mg** Ventra 20mg gastro-resistant capsules | 28 capsule [Pom] £2.97 DT price = £3.30

### Gastro-resistant tablet
- **Esomeprazole (Non-proprietary)**
  - Esomeprazole (as Esomeprazole magnesium trihydrate)
    - **20 mg** Esomeprazole 20mg gastro-resistant tablets | 28 tablet [Pom] £18.50 DT price = £2.65
  - **40 mg** Esomeprazole 40mg gastro-resistant tablets | 28 tablet [Pom] £25.19 DT price = £3.31
- **Nexium (AstraZeneca UK Ltd, Pfizer Consumer Healthcare Ltd)**
  - Esomeprazole (as Esomeprazole magnesium trihydrate)
    - **20 mg** Nexium 20mg gastro-resistant tablets | 28 tablet [Pom] £18.50 DT price = £2.65
  - **40 mg** Nexium 40mg gastro-resistant tablets | 28 tablet [Pom] £25.19 DT price = £3.31

### Powder for solution for injection
- **Esomeprazole (Non-proprietary)**
  - Esomeprazole (as Esomeprazole sodium)
    - **40 mg** Esomeprazole 40mg powder for solution for injection vials | 1 vial [Pom] £3.07–£3.13 (Hospital only)
- **Nexium (AstraZeneca UK Ltd)**
  - Esomeprazole (as Esomeprazole sodium)
    - **40 mg** Nexium LV 40mg powder for solution for injection vials | 1 vial [Pom] £4.25 (Hospital only)

### Gastro-resistant granules
- **Nexium (AstraZeneca UK Ltd)**
  - Esomeprazole (as Esomeprazole magnesium trihydrate)
    - **10 mg** Nexium 10mg gastro-resistant granules sachets | 28 sachet [Pom] £25.19 DT price = £25.19

---

**Lansoprazole**

**INDICATIONS AND DOSE**

**Benign gastric ulcer**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**Duodenal ulcer**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

---

**NSAID-associated duodenal ulcer**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

---

**Gastro-oesophageal reflex disease**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

---

**Acid-related dyspepsia**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

---

**Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

---

**UNLICENSED USE**
Not licensed for use in children.

**INTERACTIONS**
- Appendix 1: proton pump inhibitors

**SIDE-EFFECTS**
- Very rare: Colitis - raised serum cholesterol - raised triglycerides
- Frequency not known: Anorexia - glossitis - impotence - pancreatitis - petechiae - purpura - restlessness - tremor

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
Avoid – present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Use half normal dose in moderate to severe liver disease.

**DIRECTIONS FOR ADMINISTRATION**
Orodispensible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

**PATIENT AND CARER ADVICE**
Counselling on administration of orodispensible tablet advised.

Medicines for Children leaflet: Lansoprazole for gastro-oesophageal reflux disease (GORD) and ulcers
[www.medicinesforchildren.org.uk/lansoprazole-for-gord-and-ulcers](http://www.medicinesforchildren.org.uk/lansoprazole-for-gord-and-ulcers)

**INDICATIONS AND DOSE**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**Duodenal ulcer**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

** NSAID-associated duodenal ulcer**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**Gastro-oesophageal reflux disease**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**Acid-related dyspepsia**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis**
- **BY MOUTH**
  - Child (body-weight up to 30 kg): 0.5 – 1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15 – 30 mg once daily, doses to be taken in the morning

**UNLICENSED USE**
Not licensed for use in children.

**INTERACTIONS**
- Appendix 1: proton pump inhibitors

**SIDE-EFFECTS**
- Very rare: Colitis - raised serum cholesterol - raised triglycerides
- Frequency not known: Anorexia - glossitis - impotence - pancreatitis - petechiae - purpura - restlessness - tremor

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
Avoid – present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Use half normal dose in moderate to severe liver disease.

**DIRECTIONS FOR ADMINISTRATION**
Orodispensible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

**PATIENT AND CARER ADVICE**
Counselling on administration of orodispensible tablet advised.

Medicines for Children leaflet: Lansoprazole for gastro-oesophageal reflux disease (GORD) and ulcers
[www.medicinesforchildren.org.uk/lansoprazole-for-gord-and-ulcers](http://www.medicinesforchildren.org.uk/lansoprazole-for-gord-and-ulcers)
Omeprazole

- **INDICATIONS AND DOSE**

  *Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

  - **BY MOUTH**
    - Child 1–5 years: 1–2 mg/kg once daily (max. per dose 40 mg)
    - Child 6–11 years: 1–2 mg/kg once daily (max. per dose 40 mg)
    - Child 12–17 years: 40 mg once daily

  - **Treatment of duodenal ulcers including those complicating NSAID therapy** | **Treatment of benign gastric ulcers including those complicating NSAID therapy**
    - **BY MOUTH**
      - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
      - Child 1 month–1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
      - Child 2–17 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily, in severe ulcerating reflux oesophagitis, maximum 12 weeks at higher dose
      - Child 2–17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily, in severe ulcerating reflux oesophagitis, maximum 12 weeks at higher dose
      - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

  - **Zollinger–Ellison syndrome**
    - **BY MOUTH**
      - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
      - Child 1 month–1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
      - Child 2–17 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
      - Child 2–17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily
      - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 1 month–11 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
      - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

- **INTERACTIONS** → Appendix 1: proton pump inhibitors
- **SIDE-EFFECTS** Agitation · impotence

---

**UNLICENSED USE** Capsules and tablets not licensed for use in children except for severe ulcerating reflux oesophagitis in children under 1 year. *Injection* not licensed for use in children under 12 years.
DIRECTIONS FOR ADMINISTRATION

BREAST FEEDING

■ Not known to be harmful.

■ Present in milk but not known to be harmful.

■ No more than 700 micrograms/kg (max. 20 mg) once daily.

■ For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.

■ For administration through an enteral feeding tube, use Losec MUPS® or the contents of a capsule containing omeprazole dispersed in a large volume of water, or in 10 mL Sodium Bicarbonate 8.4% (1 mmol Na+ /mL). Allow to stand for 10 minutes before administration.

■ With intravenous use For intermittent intravenous infusion, dilute reconstituted solution to a concentration of 400 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Omeprazole for gastro-oesophageal reflux disease (GORD) www.medicinesforchildren.org.uk/omeprazole-for-gord

■ With oral use Counselling on administration advised.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

Management

Gastro-oesophageal reflux disease includes non-erosive gastro-oesophageal reflux and erosive oesophagitis. Uncomplicated gastro-oesophageal reflux is common in infancy and most symptoms, such as intermittent vomiting or repeated, effortless regurgitation, resolve without treatment between 12 and 18 months of age. Older children with gastro-oesophageal reflux disease may have heartburn, acid regurgitation and dysphagia. Oesophageal inflammation (oesophagitis), ulceration or stricture formation may develop in early childhood; gastro-oesophageal reflux disease may also be associated with chronic respiratory disorders including asthma.

Parents and carers of neonates and infants should be reassured that most symptoms of uncomplicated gastro-oesophageal reflux resolve without treatment. An increase in the frequency and a decrease in the volume of feeds may reduce symptoms. A feed thickener or pre-thickened formula feed can be used on the advice of a dietitian. If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. A thickening agent should be tried for up to 2 weeks before considering other treatment.

Older children should be advised about lifestyle changes such as weight reduction if overweight, and the avoidance of alcohol and smoking. An alginate-containing antacid can be used to relieve symptoms.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital. On the advice of a paediatrician, a histamine H2-receptor antagonist can be used to relieve symptoms of gastro-oesophageal reflux disease, promote mucosal healing and permit reduction in antacid consumption. A proton pump inhibitor can be used for the treatment of moderate, non-erosive oesophagitis that is unresponsive to an H2-receptor antagonist.

Endoscopically confirmed erosive, ulcerative, or stricturing disease in children is usually treated with a proton pump inhibitor. Reassessment is necessary if symptoms persist despite 4–6 weeks of treatment; long-term use of an H2-receptor antagonist or proton pump inhibitor should not be undertaken without full assessment of the underlying condition. For endoscopically confirmed erosive, ulcerative, or stricturing disease, the proton pump inhibitor usually needs to be maintained at the minimum effective dose.

Motility stimulants, such as erythromycin p. 316 may improve gastro-oesophageal sphincter contraction and accelerate gastric emptying. Evidence for the long-term efficacy of motility stimulants in the management of gastro-oesophageal reflux in children is unconvincing.
Food allergy

Food allergy

Description of condition

Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow’s milk, hen’s eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow’s milk allergy).

Management of food allergy

Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 161 is licensed as an adjunct to dietary avoidance in children with food allergy. Educating the child or their carer about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. For children in whom elimination diets might affect growth, a consultation with a nutritionist is recommended to identify alternative dietary sources.

Drug treatment

There is low quality evidence to support the use of antihistamines to treat acute, non-life-threatening symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred (see Antihistamines, under Antihistamines, allergen immunotherapy and allergic emergencies p. 165). Chlorphenamine maleate p. 172 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, adrenaline/epinephrine p. 132 is the first-line immediate treatment (see also Allergic emergencies, under Antihistamines, allergen immunotherapy and allergic emergencies p. 165). Carers and children (of an appropriate age) who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine.

Cow’s milk allergy

Parents of infants with suspected allergy to cow’s milk should be informed about the most appropriate hypoallergenic formula or milk substitute. Cow’s milk avoidance is recommended for the mothers of breast-fed infants who have cow’s milk allergy. Children who are allergic to milk should receive alternative dietary sources of calcium and vitamin D.

5 Food allergy

4.4 Helicobacter pylori diagnosis

Diagnosis of gastro-duodenal Helicobacter pylori infection

By mouth

Child: (consult product literature)
Useful Resources

6 Gastro-intestinal smooth muscle spasm

Antispasmodics

Antimuscarinics
The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome*.

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are occasionally used for the management of *irritable bowel syndrome*.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm includes the tertiary amine dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 61 and hyoscine butylbromide p. 61. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood-brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride, may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection may be useful in endoscopy and radiology.

Other indications for antimuscarinic drugs include asthma and airways disease, motion sickness, urinary frequency and enuresis, mydriasis and cycloplegia, premedication, palliative care and as an antidote to organophosphorus poisoning.

Other antispasmodics
Alverine citrate p. 62, mebeverine hydrochloride p. 62, and peppermint oil p. 34 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome*, and *primary dysmenorrhoea*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

Motility stimulants
Domperidone is a dopamine receptor antagonist which stimulates gastric emptying and small intestinal transit, and enhances the strength of oesophageal sphincter contraction. The MHRA/CHM has issued restrictions on its use because domperidone is associated with a small increased risk of serious cardiac side effects.

A low dose of erythromycin p. 316 stimulates gastro-intestinal motility and may be used on the advice of a paediatric gastroenterologist to promote tolerance of enteral feeds; erythromycin may be less effective as a prokinetic drug in preterm neonates than in older children.

ANTIMUSCARINICS

Dicycloverine hydrochloride (Dicyclomine hydrochloride)

- **INDICATIONS AND DOSE**
  - Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
  - **BY MOUTH**
    - Child 6-23 months: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
    - Child 2-11 years: 10 mg 3 times a day
    - Child 12-17 years: 10–20 mg 3 times a day

- **CONTRA-INDICATIONS** Child under 6 months
- **INTERACTIONS** → Appendix 1: antacids, dicycloverine
- **PREGNANCY** Not known to be harmful; manufacturer advises use only if essential.
- **BREAST FEEDING** Avoid—present in milk; apnoea reported in infant.
- **EXCEPTIONS TO LEGAL CATEGORY** Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral solution**
    - Dicycloverine hydrochloride (Non-proprietary) 10mg/5ml oral solution | 100 ml [Po] no price available | 120 ml [Po] £196.36 DT price = £178.79 | 300 ml [Po] no price available
  - **Tablet**
    - Dicycloverine hydrochloride (Non-proprietary) 10mg Dicycloverine 10mg tablets | 100 tablet [Po] £201.22 DT price = £184.25 | Dicycloverine hydrochloride 20mg Dicycloverine 20mg tablets | 84 tablet [Po] £203.42 DT price = £196.69

Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride above, aluminium hydroxide p. 572, simeticone p. 51.

- **INDICATIONS AND DOSE**
  - Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
  - **BY MOUTH**
    - Child 12-17 years: 10–20 mL every 4 hours as required

- **INTERACTIONS** → Appendix 1: antacids, dicycloverine

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Kolanticon (Peckforton Pharmaceuticals Ltd)
      - Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml, Aluminium hydroxide dried 40 mg per 1 ml Kolanticon gel sugar-free | 200 ml [Po] £4.00 sugar-free | 500 ml [Po] £6.00
Hyoscine butylbromide

13-Mar-2017

**INDICATIONS AND DOSE**

**Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm**

- **BY MOUTH**
  - Child 6–11 years: 10 mg 3 times a day
  - Child 12–17 years: 20 mg 4 times a day

**Acute spasm** | Spasm in diagnostic procedures

- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 2–5 years: 5 mg, then (by intramuscular injection or by slow intravenous injection) 5 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 15 mg per day
  - Child 6–11 years: 5–10 mg, then (by intramuscular injection or by intravenous injection) 5–10 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 30 mg per day
  - Child 12–17 years: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 80 mg per day

**Excessive respiratory secretions in palliative care**

- **BY MOUTH**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

**Bowel colic (in palliative care)**

- **BY MOUTH**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

**PHARMACOKINETICS**

Administration by mouth is associated with poor absorption.

**CONTRA-INDICATIONS**

- With intramuscular use or intravenous use: Tachycardia

**INTERACTIONS**

- Appendix 1: hyoscine

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Anaphylaxis

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - With intramuscular use or intravenous use: Tachycardia
  - Uncommon
  - With oral use: Tachycardia
  - Frequency not known
  - With intramuscular use or intravenous use: Hypotension

- **PREGNANCY**
  - Manufacturer advises avoid.

- **BREAST FEEDING**
  - Amount too small to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use: For administration by **mouth**, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.

- With intravenous use: For **intravenous injection**, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

**PRESCRIBING AND DISPENSING INFORMATION**

**Palliative care**

For further information on the use of hyoscine butylbromide in palliative care, see www.palliativedrugs.com/formulary/en/bnf-1-2.html.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **Buscopan** (Boehringer Ingelheim Ltd)
  - Hyoscine butylbromide 20 mg per 1 ml
  - Buscopan 20mg/1ml solution for injection ampoules | 10 ampoule [Rx] £2.92 DT price = £2.92

- **Tablet**
  - **Buscopan** (Boehringer Ingelheim Self-Medication Division, Boehringer Ingelheim Ltd)
  - Hyoscine butylbromide 10 mg
  - Buscopan 10mg tablets | 56 tablet [Rx] £3.00 DT price = £3.00

**Propantheline bromide**

13-Mar-2017

**INDICATIONS AND DOSE**

**Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm**

- **BY MOUTH**
  - Child 1 month–11 years: 300 micrograms/kg 3–4 times a day (max. per dose 15 mg), dose to be taken at least one hour before food
  - Child 12–17 years: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day

**CONTRA-INDICATIONS**

- With intramuscular use or intravenous use: Tachycardia

**INTERACTIONS**

- Appendix 1: propantheline

**SIDE-EFFECTS**

- Facial flushing

- **PREGNANCY**
  - Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING**
  - May suppress lactation.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: HYOSCINE BUTYLBROMIDE (BUSCOPAN®) INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia, hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease. Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.
7 Liver disorders and related conditions

7.1 Biliary disorders

**Cholelithiasis**

**Description of condition**
Cholelithiasis is a common condition characterized by the presence of gallstones in the gallbladder. It is usually asymptomatic, but in some cases, it can lead to pain in the upper right quadrant of the abdomen, jaundice, and symptoms of acute cholecystitis.

**Treatment**

- **Medical treatment** typically involves dietary changes and bile acid sequestrants to decrease bile acid saturation and super-saturations. Bile acid sequestrants like cholestyramine and colestipol can be used to lower cholesterol levels and prevent gallstone formation.
- **Surgical treatment** may be necessary in cases of symptomatic cholelithiasis, including cholecystectomy (removal of the gallbladder) if the stones are too large or if complications such as cholecystitis or gallstone pancreatitis arise.
- **Lithotripsy** is a non-surgical option that uses shock waves to fragment gallstones, which can be removed through the bile duct and eliminated through the stool.
- **Endoscopic retrograde cholangiopancreatography (ERCP)** is a procedure that allows for the insertion of a small tube into the bile duct, where stones can be extracted using a variety of techniques.

**Preventive measures**

- Maintaining a healthy weight and regular exercise can help reduce the risk of gallstones.
- Adequate hydration and a balanced diet can also help prevent gallstone formation.

**Reference**

Ursodeoxycholic acid p. 64 [unlicensed] and colestyramine p. 125 [unlicensed under 6 years] are used to relieve cholestatic pruritus in children, even if evidence to support their use is limited.
Inborn errors of primary bile acid synthesis

Description of condition
Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

Treatment
Cholic acid p. 64 is licensed for the treatment of inborn errors of primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid below [unlicensed] and ursodeoxycholic acid p. 64 [unlicensed indication] have been used to treat inborn errors in primary bile acid synthesis, but there is an absence of evidence to recommend their use. Chenodeoxycholic acid and ursodeoxycholic acid are available from Special-order manufacturers p. 1029 or specialist importing companies.

Primary biliary cholangitis

Description of condition
Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

Treatment
Ursodeoxycholic acid p. 64 is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain.

Smith-Lemli-Opitz syndrome

Description of condition
Smith-Lemli-Opitz syndrome is an inborn error of cholesterol synthesis. It is characterised by multiple congenital anomalies, intellectual deficit, growth delay, microcephaly, and behavioural problems. The disease is present at birth, but may be detected in later childhood or adulthood in mild forms. Hypoglycaemia due to adrenal insufficiency can present as an acute manifestation.

Aims of treatment
There is currently no cure for Smith-Lemli-Opitz syndrome. Management is aimed at symptom relief and alleviation of functional disabilities.

Bile acids

Chenodeoxycholic acid

INDICATIONS AND DOSE

Cerebrotendinous xanthomatosis
► BY MOUTH
- Child: 5 mg/kg 3 times a day
- Neonate: 5 mg/kg 3 times a day

Defective synthesis of bile acid
► BY MOUTH
- Child: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day.
- Neonate: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day

Smith-Lemli-Opitz syndrome
► BY MOUTH
- Child: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses.
- Neonate: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses

UNLICENSED USE
Not licensed.

CONTRA-INDICATIONS
Non-functioning gall bladder • radio-opaque stones

INTERACTIONS
Appendix 1: chenodeoxycholic acid

SIDE-EFFECTS
Rare • Diarrhoea

PREGNANCY
Avoid—fetotoxicity reported in animal studies.

DIRECTIONS FOR ADMINISTRATION
For administration by mouth, add the contents of a 250 mg capsule to 25 mL of sodium bicarbonate solution 8.4% (1 mmol/mL) to produce a suspension containing chenodeoxycholic acid 10 mg/mL; use immediately after preparation, discard any remaining suspension.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from Special-order manufacturers include: tablet, capsule

Tablet
► Chenodeoxycholic acid (Non-proprietary)
Chenodeoxycholic acid 250 mg Chenodiol 250mg tablets | 100 tablet no price available

Capsule
► Chenodeoxycholic acid (Non-proprietary)
Chenodeoxycholic acid 250 mg Xenbilox 250mg capsules | 100 capsule no price available
Cholic acid

**INDICATIONS AND DOSE**

Inborn errors of primary bile acid synthesis (initiated by a specialist)

- **BY MOUTH**
  - Child (body-weight up to 10 kg): 50 mg daily, then increased in steps of 50 mg daily in divided doses; usual dose 5–15 mg/kg daily in divided doses, dose to be given with food at the same time each day
  - Child (body-weight 10 kg and above): Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

**INTERACTIONS** → Appendix 1: cholic acid

**SIDE-EFFECTS** Diarrhoea - gallstones (long term use) - pruritus

SIDE-EFFECTS, FURTHER INFORMATION

Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.

**PREGNANCY** Limited data available—not known to be harmful, manufacturer advises continue treatment.

Manufacturer advises monitor patient parameters more frequently in pregnancy.

**BREAST FEEDING** Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises monitor closely.

**MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.

**PATIENT AND CARER ADVICE** Counselling advised on administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

Ursodeoxycholic acid

**INDICATIONS AND DOSE**

**Cholestasis**

- **BY MOUTH**
  - Neonate: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response.
  - Child 1–23 months: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response

Improvement of hepatic metabolism of essential fatty acids and bile flow, in children with cystic fibrosis

- **BY MOUTH**
  - Child: 10–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses

**Cholestasis associated with total parenteral nutrition**

- **BY MOUTH**
  - Neonate: 10 mg/kg 3 times a day.

**Sclerosing cholangitis**

- **BY MOUTH**
  - Child: 10 mg/kg 3 times a day

**SIDE-EFFECTS**

Rare Diarrhoea

**PREGNANCY** No evidence of harm but manufacturer advises avoid.

**BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).

**PATIENT AND CARER ADVICE**

Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

7.2 Oesophageal varices

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Terlipressin acetate

- **INDICATIONS AND DOSE**
  - **GLYPRESSIN® INJECTION**
    Adjunct in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)
    - **BY INTRAVENOUS INJECTION**
      - Child 12-17 years (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
      - Child 12-17 years (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

Vasopressin

- **INDICATIONS AND DOSE**
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Child: Initially 0.3 unit/kg (max. per dose 20 units), dose to be administered over 20–30 minutes, then 0.3 unit/kg/hour, adjusted according to response (max. per dose 1 unit/kg/hour), if bleeding stops, continue at same dose for 12 hours, then withdraw gradually over 24–48 hours; max. duration of treatment 72 hours, dose may alternatively be infused directly into the superior mesenteric artery
Obesity

Description of condition
Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, and obstructive sleep apnoea syndrome. It can also contribute to psychological and psychiatric morbidities. In children and adolescents, body mass index (BMI) should be used as a practical estimation of body fat. However, it should be interpreted with caution as it is not a direct measure of adiposity. Assessing the BMI of children is more complicated than for adults because it changes as they grow and mature, with different growth patterns seen between boys and girls.

Public Health England advises that the British 1990 (UK90) growth reference charts should be used to determine the weight status of children. A child ≥ the 91st centile is classified as overweight, and as obese if ≥ the 98th centile. Waist circumference is not recommended as a routine measure, but should be used as an additional predictor for risk of developing other long-term health problems. Children who are overweight or obese and have significant comorbidities or complex needs should be considered for specialist referral.

Aims of treatment
Children who are overweight or obese and are no longer growing taller will ultimately need to lose weight and maintain weight loss to improve their BMI. However, preventing further weight gain while making lifestyle changes, may be an appropriate short-term aim.

Overview
The goals of management of obesity should be agreed together with the child and their parents or carers; parents or carers should be encouraged to take responsibility for lifestyle changes of their children. Referral to a specialist can be considered for children who are overweight or obese and have significant comorbidities or complex needs (e.g. learning disabilities). Children should be assessed for comorbidities such as hypertension, hyperinsulinaemia, dyslipidaemia, type 2 diabetes, psychosocial dysfunction, and exacerbation of conditions such as asthma.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications, which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin, (when used in the treatment of type 2 diabetes), sodium valproate, and tricyclic antidepressants.

Lifestyle changes
Obese children should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity and improve diet and eating behaviour. These changes should be encouraged within the whole family. Any dietary changes should be age appropriate and consistent with healthy eating recommendations. Surgical intervention is not generally recommended in children or adolescents.

Drug treatment
Drug treatment is not generally recommended for children younger than 12 years, unless there are exceptional circumstances, such as if severe comorbidities are present. In children over 12 years, drug treatment is only recommended if physical comorbidities, such as orthopaedic problems or sleep apnoea, or severe psychological comorbidities are present. Drug treatment should never be used as the sole element of treatment and should be used as part of an overall weight management plan. Orlistat below [unlicensed use] is the only drug currently available in the UK that is recommended specifically for the treatment of obesity; it acts by reducing the absorption of dietary fat. Treatment should be started and monitored in a specialist paediatric setting by experienced multidisciplinary teams. An initial 6–12 month trial is recommended, with regular review to assess effectiveness, adverse effects and adherence.

Treatment may also be used to maintain weight loss rather than to continue to lose weight. A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for younger children who need vitamins and minerals for growth and development.

Useful Resources

L I P A S E I N H I B I T O R S

Orlistat

**DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

**INDICATIONS AND DOSE**

Adjunct in obesity

**BY MOUTH**

- Child 12–17 years (initiated by a specialist): 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only under specialist supervision, if a meal is missed or contains no fat, the dose of orlistat should be omitted
9 Rectal and anal disorders

9.1 Anal fissures

Anal fissure 31-Aug-2016

Description of condition
An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa. Constipation (passage of hard stools) is the most common cause in children. The majority of anal fissures are posterior, and an underlying cause should be considered (secondary anal fissure) if fissures are multiple, occur laterally, and are refractory to treatment. If constipation is present, it should be treated, see Constipation p. 38.

Drug treatment
If constipation is present, it should be treated, see Constipation p. 38.

Aims of treatment
The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment
Initial management of acute anal fissures should focus on ensuring that stools are soft and easily passed. Osmotic laxatives, such as lactulose p. 40 or macrogols (macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 41), are recommended. A simple analgesic (such as paracetamol p. 260 or ibuprofen p. 625, may be offered for prolonged burning pain following defecation.

Children should be referred to a paediatric specialist if the anal fissure has not healed following two weeks of initial management, or earlier if there is significant pain.

Useful Resources

9.2 Haemorrhoids

Haemorrhoids 01-Dec-2016

Description of condition
Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Haemorrhoids in children are rare but may occur in infants with portal hypertension.

Aims of treatment
The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

Non-drug treatment
Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching.

Drug treatment
If constipation is present, it should be treated, see Constipation p. 38.

A simple analgesic, such as paracetamol p. 260, can be used for pain relief. NSAIDs should be avoided if rectal bleeding is present.

Symptomatic treatment with a locally applied preparation is appropriate for short periods. Manufacturer advises preparations containing local anaesthetics (lidocaine, cinchocaine, and pramocaine [unlicensed]) should only be used for a few days as they may cause sensitisation of the anal skin—local anaesthetic ointments can be absorbed through the rectal mucosa (with a theoretical risk of systemic effects) and very rarely may cause increased irritation; excessive application should be avoided in infants and children.

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. Manufacturer advises long-term use of corticosteroid creams can cause ulceration and permanent damage due to thinning of the perianal skin and should be avoided. Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects (particularly in infants).
CORTICOSTEROIDS

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

- **INDICATIONS AND DOSE**
  - **Haemorrhoids | Pruritus ani**
    - **BY RECTUM USING OINTMENT**
      - Child 12-17 years: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement
    - **BY RECTUM USING SUPPOSITORIES**
      - Child 12-17 years: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application), particularly in children and infants - local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - Anusol-Hc (McNeil Products Ltd)
      - Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram. Anusol HC ointment | 30 gram (Pom) £2.49
  - **Suppository**
    - Anusol-Hc (McNeil Products Ltd)
      - Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg. Anusol HC suppositories | 12 suppository (Pom) £1.74

Benzyl benzoate with bismuth oxide, hydrocortisone acetate, peru balsam, pramocaine hydrochloride and zinc oxide

- **INDICATIONS AND DOSE**
  - **Haemorrhoids | Pruritus ani**
    - **BY RECTUM**
      - Child 12-17 years: Apply twice daily for no longer than 7 days, to be applied morning and night and after a bowel movement

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - No licensed medicines listed.

10 Reduced exocrine secretions

Exocrine pancreatic insufficiency

14-Dec-2016

**Description of condition**

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.

The main clinical manifestations are maldigestion and malnutrition, associated with low circulating levels of...
micronutrients, fat-soluble vitamins and lipoproteins. Children also present with gastro-intestinal symptoms, such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from cystic fibrosis, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

Aims of treatment
The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

Drug treatment
Pancreatic enzyme replacement therapy with pancreatin below is the mainstay of treatment for children with exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body.

Fibrosing colonopathy has been reported in children with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10,000 units/kg/day of lipase). Possible risk factors are gender (boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of Pancrease HL® and Nutrizym 22® recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10,000 units/kg/day of lipase. Manufacturers recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. Acid-suppressing drugs (proton pump inhibitors or H₂-receptor antagonists) may be trialled in children who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation recommended whenever necessary.

### Non-drug treatment
Dietary advice should be provided. Food intake should be distributed between three meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended.

Medium-chain triglycerides (see MCT oil, in Borderline substances), which are directly absorbed by the intestinal mucosa, were thought to be useful in some children. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

### PANCREATIC ENZYMES

#### Drug action
Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

#### Indications and dose

Creon® 10000

**Pancreatic insufficiency**

- **By mouth**
  - Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

Creon® 25000

**Pancreatic insufficiency**

- **By mouth**
  - Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

Creon® 40000

**Pancreatic insufficiency**

- **By mouth**
  - Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**Creon® Micro**

**Pancreatic insufficiency**

- **By mouth**
  - Child: Initially 100 mg, for administration advice, see Directions for administration

**Dose equivalence and conversion**

For Creon® Micro: 100 mg granules = one measured scoopful (scoop supplied with product).
Pancreatic insufficiency

**BY MOUTH**

- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with meals, washed down or mixed with milk or water

**PANCREASE HL®**

Pancreatic insufficiency

**BY MOUTH**

- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

**PANCREX®**

Pancreatic insufficiency

**BY MOUTH**

- Child 2–17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water

**PANCREX® V**

Pancreatic insufficiency

**BY MOUTH**

- Child 1–11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child 1–7 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

**PANCREX® V CAPSULES ‘125’**

Pancreatic insufficiency

**BY MOUTH**

- Neonate: 1–2 capsules, contents of capsule to be given in each feed (or mixed with feed and given by spoon).

**PANCREX® V POWDER**

Pancreatic insufficiency

**BY MOUTH**

- Neonate: 250–500 mg, dose to be taken with each feed.

**PANCREX® V TABLETS**

Pancreatic insufficiency

**BY MOUTH**

- Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

**PANCREX® V TABLETS FORTE**

Pancreatic insufficiency

**BY MOUTH**

- Child 2–17 years: 5–15 tablets, to be taken before meals

### CONTRA-INDICATIONS

**PANCREASE HL®** Should not be used in children aged 15 years or less with cystic fibrosis

**NUTRIZYM 22® GASTRO-RESISTANT CAPSULES** Should not be used in children aged 15 years or less with cystic fibrosis

### CAUTIONS

Can irritate the perioral skin and buccal mucosa if retained in the mouth. Excessive doses can cause perianal irritation

### INTERACTIONS

- Appendix 1: pancreatin

### SIDE-EFFECTS

Abdominal discomfort, hyperuricaemia (associated with very high doses), hyperuricosuria (associated with very high doses), mucosal irritation, nausea, skin irritation, vomiting

### PREGNANCY

Not known to be harmful.

### DIRECTIONS FOR ADMINISTRATION

Pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, Creon Micro® granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby’s bottle. Manufacturer advises Pancrex® V powder may be administered via nasogastric tube or gastrostomy tube—consult local and national guidelines.

### PRESCRIBING AND DISPENSING INFORMATION

Preparations may contain pork pancreatin—consult product literature.

### HANDLING AND STORAGE

Hypersensitivity reactions occur occasionally and may affect those handling the powder.

### PATIENT AND CARER ADVICE

Patients or carers should be given advice on administration.

It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Medicines for Children leaflet: Pancreatin for pancreatic insufficiency [www.medicinesforchildren.org.uk/pancreatin-for-pancreatic-insufficiency](http://www.medicinesforchildren.org.uk/pancreatin-for-pancreatic-insufficiency)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

- Creon (Mylan Ltd)
  - Protease 600 unit, Amylase 8000 unit, Lipase 10000 unit
  - Creon 10000 gastro-resistant capsules | 100 capsule £12.93
  - Protease 1000 unit, Amylase 18000 unit, Lipase 25000 unit
  - Creon 25000 gastro-resistant capsules | 100 capsule £28.25
  - Protease 1600 unit, Amylase 25000 unit, Lipase 40000 unit
  - Creon 40000 gastro-resistant capsules | 100 capsule £41.80
- Nutrizym (Merck Serono Ltd)
  - Protease 1100 unit, Amylase 19800 unit, Lipase 22000 unit Nutrizym 22 gastro-resistant capsules | 100 capsule £33.33
- Pancrease (Jassen-Cilag Ltd)
  - Protease 1250 unit, Amylase 22500 unit, Lipase 25000 unit
  - Pancrease HL gastro-resistant capsules | 100 capsule £40.38

**Gastro-resistant tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - **5, 25**
  - **Pancrex** (Essential Pharmaceuticals Ltd)
    - Protease 110 unit, Amylase 1700 unit, Lipase 1900 unit
      - Pancrex V gastro-resistant tablets | 300 tablet £38.79
    - Protease 330 unit, Amylase 5000 unit, Lipase 5600 unit
      - Pancrex V Forte gastro-resistant tablets | 300 tablet £48.11

**Gastro-resistant granules**

- **CAUTIONARY AND ADVISORY LABELS**
  - **25**
  - **Creon** (Mylan Ltd)
    - Protease 200 unit, Amylase 3600 unit, Lipase 5000 unit
      - Creon Micro Pancreatin 60.12mg gastro-resistant granules | 20 gram £31.50
  - **Pancrex** (Essential Pharmaceuticals Ltd)
    - Protease 300 unit, Amylase 4000 unit, Lipase 5000 unit
      - Pancrex gastro-resistant granules | 300 gram £57.00
Stoma care

11 Stoma care

Stoma care

Description of condition
A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient’s pharmaceutical needs correctly.

Overview
Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

Analgesics
Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

Antacids
The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

Antisecretory drugs
The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 445) are often used to reduce this risk.

Antidiarrhoeal drugs
Loperamide hydrochloride p. 47 and codeine phosphate p. 265 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

Digoxin
Children with a stoma are particularly susceptible to hypokalaemia. This predisposes children on digoxin p. 79 to digoxin toxicity; potassium supplements or a potassium-sparing diuretic may be advisable.

Diuretics
Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Iron preparations
Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Laxatives
Laxatives should be used in children with stoma only under specialist supervision; they should be prescribed with caution for those with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible it should be treated by increasing fluid intake or dietary fibre. If a laxative is required, it should generally be used for short periods only.

Care of stoma
Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Arrhythmias

Overview
Management of an arrhythmia requires precise diagnosis of the type of arrhythmia; electrocardiography and referral to a paediatric cardiologist is essential; underlying causes such as heart failure require appropriate treatment.

Bradyarrhythmias
Adrenaline/epinephrine p. 132 is useful in the treatment of symptomatic bradycardia in an infant or child.

Supraventricular tachycardia
In supraventricular tachycardia adenosine p. 77 is given by rapid intravenous injection. If adenosine is ineffective, intravenous amiodarone hydrochloride p. 76, flecainide acetate p. 75, or a beta-blocker (such as esmolol hydrochloride p. 103) can be tried; verapamil hydrochloride p. 106 can also be considered in children over 1 year. Atenolol p. 103, sotalol hydrochloride p. 78 and flecainide acetate are used for the prophylaxis of paroxysmal supraventricular tachycardias.

The use of d.c. shock and vagal stimulation also have a role in the treatment of supraventricular tachycardia.

Syndromes associated with accessory conducting pathways
Amiodarone hydrochloride, flecainide acetate, or a beta-blocker is used to prevent recurrence of supraventricular tachycardia in infants and young children with these syndromes (e.g. Wolff-Parkinson-White syndrome).

Atrial flutter
In atrial flutter without structural heart defects, sinus rhythm is restored with d.c. shock or cardiac pacing; drug treatment is usually not necessary. Amiodarone hydrochloride is used in atrial flutter when structural heart defects are present or after heart surgery. Sotalol hydrochloride may also be considered.

Atrial fibrillation
Atrial fibrillation is very rare in children. To restore sinus rhythm d.c. shock is used; beta-blockers, alone or together with digoxin p. 79 may be useful for ventricular rate control.

Ectopic tachycardia
 Intravenous amiodarone hydrochloride is used in conjunction with body cooling and synchronised pacing in postoperative junctional ectopic tachycardia. Oral amiodarone hydrochloride or flecainide acetate are used in congenital junctional ectopic tachycardia.

Amiodarone hydrochloride, flecainide acetate, or a beta-blocker are used in atrial ectopic tachycardia; amiodarone hydrochloride is preferred in those with poor ventricular function.

Ventricular tachycardia and ventricular fibrillation
Pulseless ventricular tachycardia or ventricular fibrillation require resuscitation, see Paediatric Advanced Life Support algorithm. Amiodarone hydrochloride is used in resuscitation for pulseless ventricular tachycardia or ventricular fibrillation unresponsive to d.c. shock; lidocaine hydrochloride p. 796 can be used as an alternative only if amiodarone hydrochloride is not available.

Amiodarone hydrochloride is also used in a haemodynamically stable child when drug treatment is required; lidocaine hydrochloride can be used as an alternative only if amiodarone hydrochloride is not available.

Torsade de pointes
Torsade de pointes is a form of ventricular tachycardia associated with long QT syndrome, which may be congenital or drug induced. Episodes may be self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous magnesium sulfate can be used to treat torsade de pointes (dose recommendations vary—consult local guidelines). Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias
Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:
### Arrhythmias

- **Class I: membrane stabilising drugs** (e.g., lidocaine, flecaïnide)
- **Class II: beta-blockers**
- **Class III: amiodarone; sotalol (also Class II)**
- **Class IV: calcium-channel blockers** (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Adenosine is the treatment of choice for terminating supraventricular tachycardias, including those associated with accessory conducting pathways (e.g., Wolff-Parkinson-White syndrome). It is also used in the diagnosis of supraventricular arrhythmias. It is not negatively inotropic and does not cause significant hypotension. The injection should be administered by rapid intravenous injection into a central or large peripheral vein.

Amiodarone hydrochloride is useful in the management of both supraventricular and ventricular tachyarrhythmias. It can be given by intravenous infusion and by mouth, and causes little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly. Intravenous amiodarone hydrochloride is also used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless ventricular tachycardia unresponsive to d.c. shock.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride has a role in the management of ventricular arrhythmias.

Oral administration of digoxin slows the ventricular rate in atrial fibrillation and in atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate.

Flecainide acetate is useful for the treatment of resistant re-entry supraventricular tachycardia, ventricular tachycardia, ventricular ectopic beats, arrhythmias associated with accessory conducting pathways (e.g., Wolff-Parkinson-White syndrome), and paroxysmal atrial fibrillation. Flecainide crosses the placenta and can be used to control fetal supraventricular arrhythmias.

Lidocaine hydrochloride can be used in cardiopulmonary resuscitation in children with ventricular fibrillation or pulseless ventricular tachycardia unresponsive to d.c. shock, but only if amiodarone hydrochloride is not available. Doses may need to be reduced in children with persistently poor cardiac output and hepatic or renal failure.

Verapamil hydrochloride can cause severe haemodynamic compromise (refractory hypotension and cardiac arrest) when used for the acute treatment of arrhythmias in neonates and infants; it is contra-indicated in children under 1 year. It is also contra-indicated in those with congestive heart failure, syndromes associated with accessory conducting pathways (e.g., Wolff-Parkinson-White syndrome) and in most receiving concomitant beta-blockers. It can be useful in older children with supraventricular tachycardia.

---

### Antiarrhythmics  >  Class IB

**Lidocaine hydrochloride**

(Lignocaine hydrochloride)

#### Indications and Dose

**Ventricular arrhythmias** | **Pulseless ventricular tachycardia** | **Ventricular fibrillation**

- **Neonate:** Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.

- **Child 1 month-11 years:** Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.

- **Child 12-17 years:** Initially 50–100 mg, followed by (by intravenous infusion) 120 mg, dose to be given over 30 minutes, then (by intravenous infusion) 240 mg, dose to be given over 2 hours, then (by intravenous infusion) 60 mg/hour, reduce dose further if infusion is continued beyond 24 hours, if infusion not immediately available following initial injection, the initial injection dose may be repeated at intervals of not less than 5 minutes (to a maximum 300 mg dose in 1 hour) until infusion can be initiated.

**Neonatal seizures**

- **By intravenous infusion**

- **Neonate:** Initially 2 mg/kg; dose to be given over 10 minutes, followed by 6 mg/kg/hour for 6 hours; reduced to 4 mg/kg/hour for 12 hours, then reduced to 2 mg/kg/hour for a further 12 hours, preterm neonates may require lower doses.

---

**Other drugs used for Arrhythmias**

Metoprolol tartrate, p. 103· Propranolol hydrochloride, p. 101

---

**Unlicensed use**

Not licensed for use in children under 1 year.

**Contra-indications**

All grades of atioventricular block - severe myocardial depression - sino-atrial disorders

**Caution**

Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose).

**Side-effects**

- **Common or very common**
  - Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - drowsiness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression
  - Rare  - Anaphylaxis

**Pregnancy**

Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.

**Breastfeeding**

Present in milk but amount too small to be harmful.

**Hepatic impairment**

Caution—increased risk of side-effects.

**Renal impairment**

Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
Monitor ECG and have resuscitation facilities available.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

**MEDITICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Lidocaine hydrochloride (Non-proprietary)**
  - Lidocaine hydrochloride 5 mg per 1 ml, Lidocaine 50 mg/10 ml (0.5%) solution for injection ampoules | 10 ampoule £7.00
  - Lidocaine hydrochloride 10 mg per 1 ml, Lidocaine 100 mg/10 ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule £10.89
  - Lidocaine 100 mg/10 ml (1%) solution for injection ampoules | 10 ampoule £4.40 DT price = £4.36
  - Lidocaine 100 mg/10 ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule £8.80
  - Lidocaine 200 mg/20 ml (1%) solution for injection ampoules | 10 ampoule £7.00–£9.63 DT price = £9.63
  - Lidocaine 50 mg/5 ml (1%) solution for injection ampoules | 10 ampoule £2.57–£3.10 DT price = £2.57
  - Lidocaine 20 mg/2 ml (1%) solution for injection ampoules | 10 ampoule £3.50 DT price = £2.18
  - Lidocaine 50 mg/5 ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule £6.00
  - Lidocaine hydrochloride 20 mg per 1 ml, Lidocaine 100 mg/5 ml (2%) solution for injection ampoules | 10 ampoule £2.67–£3.80 DT price = £2.67
  - Lidocaine 400 mg/20 ml (2%) solution for injection vials | 10 vial £19.50
  - Lidocaine 200 mg/10 ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule £4.14
  - Lidocaine 40 mg/2 ml (2%) solution for injection ampoules | 10 ampoule £4.00 DT price = £2.34
  - Lidocaine 100 mg/5 ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule £6.00
  - Lidocaine 400 mg/20 ml (2%) solution for injection ampoules | 10 ampoule £8.00–£9.90 DT price = £9.90

**ANTIARRHYTHMICS ▶ CLASS IC**

**Flecainide acetate**

**INDICATIONS AND DOSE**

- **Supraventricular arrhythmias**
  - Child 12-17 years: 200 mg daily
  - Resistant re-entry supraventricular tachycardia
  - Ventricular ectopic beats or ventricular tachycardia
  - Arrhythmias associated with accessory conduction pathways (e.g. Wolff-Parkinson-White syndrome)
  - Paroxysmal atrial fibrillation

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dizziness - dyspnœa - fatigue - fever - oedema - pro-arrhythmic effects - visual disturbances
- **Rare** Amnesia - confusion - convulsions - depression - dyskinesia - hallucinations - periurinary - pneumonitis
- **PREGNANCY** Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyphertirubinaemia also reported.
- **BREAST FEEDING** Significant amount present in milk but not known to be harmful.

**UNLICENSED USE** Not licensed for use in children under 12 years.

**CONTRA-INDICATIONS** Abnormal left ventricular function - atrial conduction defects (unless pacing rescue available) - bundle branch block (unless pacing rescue available) - control of arrhythmias in acute situations (for modified-release forms only) - distal block (unless pacing rescue available) - haemodynamically significant valvular heart disease - heart failure - long-standing atrial fibrillation where conversion to sinus rhythm not attempted - second-degree or greater AV block (unless pacing rescue available) - sinus node dysfunction (unless pacing rescue available)

**CAUTIONS** Antiarrhythmic affecting heart surgery-patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

**INTERACTIONS → Appendix 1: antiarrhythmics**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate: Initially 1–2 mg/kg, dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 100–250 micrograms/kg/hour if required until arrhythmia controlled, transfer patient to oral treatment following intravenous treatment.
  - Child 1 month–11 years: Initially 2 mg/kg, dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 100–250 micrograms/kg/hour if required until arrhythmia controlled, transfer patient to oral treatment following intravenous treatment.
  - Child 12–17 years: Initially 2 mg/kg (max. per dose 150 mg), dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by continuous intravenous infusion) reduced to 100–250 micrograms/kg/hour until arrhythmia controlled, maximum cumulative dose of 600 mg in the first 24 hours, transfer patient to oral treatment following intravenous treatment.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose by half with concurrent use of amiodarone.

**DOSE EQUIVALENCE AND CONVERSION**

- Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

**HEPATIC IMPAIRMENT** Avoid or reduce dose in severe impairment. Monitor plasma-flecainide concentration.
Amiodarone hydrochloride

**INDICATIONS AND Dose**

**Supraventricular and ventricular arrhythmias (initiated in hospital or under specialist supervision)**

- **BY MOUTH**
  - Neonate: Initially 5–10 mg/kg twice daily for 7–10 days, then reduced to 5–10 mg/kg daily.
  - Child 1 month–11 years: Initially 5–10 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, then reduced to 5–10 mg/kg once daily; maximum 200 mg per day.
  - Child 12–17 years: 200 mg 3 times a day for 1 week, then 200 mg twice daily for 1 week, then usually 200 mg daily adjusted according to response.
  - **INITIALLY BY INTRAVENOUS INFUSION**
  - Neonate: Initially 5 mg/kg, then (by intravenous infusion) 5 mg/kg every 12–24 hours, dose to be given over 30 minutes.

- **Children**:
  - Initially 5–10 mg/kg, dose to be given over 20 minutes to 2 hours, then (by continuous intravenous infusion) 300 micrograms/kg/hour, adjusted according to response; (by continuous intravenous infusion) increased if necessary up to 1.5 mg/kg/hour; maximum 1.2 g per day

**Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: 5 mg/kg, dose to be given over at least 3 minutes.
  - Child: 5 mg/kg (max. per dose 300 mg), dose to be given over at least 3 minutes.

- **UNLICENSED USE**
  - Not licensed for use in children under 3 years.

- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Avoid in severe conduction disturbances (unless pacemaker fitted) • avoid in sinus node disease (unless pacemaker fitted) • avoid rapid loading after cardiac surgery • iodine sensitivity • sino-atrial heart block (except in cardiac arrest) • sinus bradycardia (except in cardiac arrest) • thyroid dysfunction
  - **SPECIFIC CONTRA-INDICATIONS**
    - With intravenous use • Avoid bolus injection in cardiomyopathy • Avoid bolus injection in congestive heart failure • Avoid in circulatory collapse • Avoid in severe arterial hypotension • Avoid in severe respiratory failure

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Acute porphyrias p. 577 • conduction disturbances (in excessive dosage) • heart failure • hypokalaemia • severe bradycardia (in excessive dosage)
  - **SPECIFIC CAUTIONS**
    - With intravenous use • Avoid benzyl alcohol containing injections in neonates (in neonates) • moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) • severe hepatocellular toxicity
  - **INTERACTIONS**
    - Appendix 1: antiarrhythmics

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common**
      - Bradycardia • hypothyroidism • hypothyroidism • jaundice • nausea • persistent slate grey skin discoloration • phototoxicity • pulmonary toxicity (including pneumonia and fibrosis) • raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) • reversible corneal microdeposits (sometimes with night glare) • sleep disorders • taste disturbances • tremor • vomiting
  - **Uncommon**
    - Conduction disturbances • onset or worsening of arrhythmia • peripheral myopathy (usually reversible on withdrawal) • peripheral neuropathy (usually reversible on withdrawal)
  - **Very rare**
    - Alopecia • aplastic anaemia • ataxia • benign intracranial hypertension • bronchospasm (in patients with severe respiratory failure) • chronic liver disease • cirrhosis • epididymo-orchitis • exfoliative dermatitis • haemolytic anaemia • headache • hypersensitivity • impaired vision due to optic neuritis or optic neuropathy (including blindness) • impotence • rash • sinus arrest • thrombocytopenia • vasculitis • vertigo
  - **Frequency not known**
    - Hot flushes • hypotension • respiratory distress syndrome • sweating
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use • Anaphylaxis on rapid injection
SIDE-EFFECTS, FURTHER INFORMATION

- Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlight glares at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.
- Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.
- Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.
- Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.
- Peripheral neuropathy Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

**PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.

**BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

**MONITORING REQUIREMENTS**

- Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore triiodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
- Liver function tests required before treatment and then every 6 months.
- Serum potassium concentration should be measured before treatment.
- Chest x-ray required before treatment.
- Pulmonary function tests required before treatment.
- With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Intravenous administration via central venous catheter recommended if repeated or continuous infusion required, as infusion via peripheral veins may cause pain and inflammation. For **intravenous infusion**, dilute to a concentration of not less than 600 micrograms/mL with Glucose 5%. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).
- With oral use For administration by mouth, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

**PATIENT AND CARER ADVICE**

Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

**ANTIARRHYTHMICS OTHER**

**Adenosine**

**INDICATIONS AND DOSE**

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

- **BY INTRAVENOUS INFUSION**
- Child: (consult product literature)

**Termination of supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Diagnosis of supraventricular arrhythmias**

- **BY RAPID INTRAVENOUS INJECTION**

**Neonate:** Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 300 micrograms/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.

- Child 1–11 months: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 500 micrograms/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.
- Child 1–11 years: Initially 100 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 12 mg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.
- Child 12–17 years: Initially 3 mg, followed by 6 mg after 1–2 minutes if required, followed by 12 mg after 1–2 minutes if required, in some children over 12 years 3 mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with heart transplant are very sensitive to the effects of adenosine, and should not receive higher initial doses

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

**UNLICENSED USE Adenocor® licensed for treatment of paroxysmal supraventricular tachycardia in children; not

INTERACTIONS

INTERACTIONS ➔ Appendix 1: antiarrhythmics

COMMON or very common Angina (discontinue) • apprehension • arrhythmia (discontinue if asystole or severe bradyarrhythmia occur) • AV block • dizziness • dyspnoea • flushing • headache • nausea • sinus pause

UNCOMMON Blurred vision • hyperventilation • metallic taste • palpitation • sweating • weakness

VERY RARE Bronchospasm • injection-site reactions • transient worsening of intracranial hypertension

FREQUENCY NOT KNOWN Cardiac arrest • convulsions • hypotension (discontinue if severe) • respiratory failure (discontinue) • syncope • vomiting

PREGNANCY Large doses may cause fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING No information available—unlikely to be present in milk owing to short half-life.

MONITORING REQUIREMENTS Monitor ECG and have resuscitation facilities available.

DIRECTIONS FOR ADMINISTRATION For rapid intravenous injection give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

ELECTROLYTES: May contain Sodium

Adenosine (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection vials [6 vial (Pom)] £26.70–£25.24 (Hospital only)

Adencor (Sanofi)

Adenosine 3 mg per 1 ml Adencor 6mg/2ml solution for injection vials [6 vial (Pom)] £29.94 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

Adenosine (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 30mg/10ml solution for infusion vials [10 vial (Pom)] £70.00–£85.57 (Hospital only)

Adenoscan (Sanofi)

Adenosine 3 mg per 1 ml Adenoscan 30mg/10ml solution for infusion vials [10 vial (Pom)] £85.57

BETA-ADRENERGIC BLOCKERS ➔ NON-SELECTIVE

Sotalol hydrochloride

INDICATIONS AND DOSE

Life-threatening arrhythmias including ventricular tachyarrhythmias

BY MOUTH

Child 12–17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, then increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days; higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

Ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)

BY MOUTH

Neonate: Initially 1 mg/kg twice daily, increased if necessary up to 4 mg/kg twice daily, dose to be increased at intervals of 3–4 days.

Atrial flutter, ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)

BY MOUTH

Child 1 month–11 years: Initially 1 mg/kg twice daily, then increased if necessary up to 4 mg/kg twice daily (max. per dose 80 mg twice daily), dose to be increased at intervals of 2–3 days

Child 12–17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days

UNLICENSED USE Not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use). Reduce dose or discontinue if corrected QT interval exceeds 550 msec.

CONTRA-INDICATIONS Long QT syndrome (congenital or acquired) • torsade de pointes

CAUTIONS Diarrhoea (severe or prolonged)

INTERACTIONS ➔ Appendix 1: beta blockers (non-selective)

SIDE-EFFECTS Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in females)

BREAST FEEDING Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

RENAL IMPAIRMENT Halve normal dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use one-quarter normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

licensed for diagnosis in children; Adenoscan® not licensed in children.

CONTRA-INDICATIONS Asthma • decompensated heart failure • long QT syndrome • second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) • severe hypotension

CAUTIONS Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) • atrial flutter with accessory pathway (conduction down anomalous pathway may increase) • autonomic dysfunction • bundle branch block • first-degree AV block • heart transplant • left main coronary artery stenosis • left to right shunt • pericardial effusion • pericarditis • QT-interval prolongation • recent myocardial infarction • severe heart failure • stenotic carotid artery disease with cerebrovascular insufficiency • stenotic valvular heart disease • uncorrected hypovolaemia

INTERACTIONS ➔ Appendix 1: antiarrhythmics

SIDE-EFFECTS

COMMON or very common Angina (discontinue) • apprehension • arrhythmia (discontinue if asystole or severe bradyarrhythmia occur) • AV block • dizziness • dyspnoea • flushing • headache • nausea • sinus pause

UNCOMMON Blurred vision • hyperventilation • metallic taste • palpitation • sweating • weakness

VERY RARE Bronchospasm • injection-site reactions • transient worsening of intracranial hypertension

FREQUENCY NOT KNOWN Cardiac arrest • convulsions • hypotension (discontinue if severe) • respiratory failure (discontinue) • syncope • vomiting

### CARDIAC GLYCOSIDES

#### Cardiac glycosides

**Digoxin-specific antibody**

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Emergency treatment of poisoning p. 803). Digoxin-specific antibody p. 812 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 779 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

**Digoxin**

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation. Digoxin has a limited role in children with chronic heart failure.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate, even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In children with heart failure who are in sinus rhythm, a loading dose may not be required.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. The plasma-digoxin concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

**Drug action**

Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

**Indications and dose**

**Supraventricular arrhythmias**

**Chronic heart failure**

#### By Mouth

- **Neonate (body-weight up to 1.5 kg):** Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- **Neonate (body-weight 1.5–2.5 kg):** Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- **Neonate (body-weight 2.6 kg and above):** Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- **Child 1 month-1 year:** Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses

- **Child 2–4 years:** Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses

- **Child 5–9 years:** Initially 25 micrograms/kg in 3 divided doses (max. per dose 750 micrograms) for 24 hours, then 6 micrograms/kg daily in 1–2 divided doses; maximum 250 micrograms per day

- **Child 10–17 years:** Initially 0.75–1.5 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses, higher doses may be necessary

#### By Intravenous Infusion

- **Neonate (body-weight up to 1.5 kg):** Initially 20 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- **Neonate (body-weight 1.5–2.5 kg):** Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- **Neonate (body-weight 2.6 kg and above):** Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- **Child 1 month-1 year:** Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses

- **Child 2–4 years:** Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses

- **Child 5–9 years:** Initially 25 micrograms/kg in 3 divided doses (max. per dose 500 micrograms) for 24 hours, then 6 micrograms/kg daily in 1–2 divided doses; maximum 250 micrograms per day

- **Child 10–17 years:** Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses

#### Dose adjustments due to interactions

Manufacturer advises reduce dose by half with concurrent use of amiodarone, droperidol and quinine.

#### Dose equivalence and conversion

- Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.

- When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.
Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

**CONTRA-INDICATIONS**
Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction— but use with caution), hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure— but use with caution), intermittent complete heart block, myocarditis, second degree AV block, supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff–Parkinson–White syndrome (although can be used in infancy)—ventricular tachycardia or fibrillation.

**CAUTIONS**
Avoid hypercalcaemia (risk of digitalis toxicity) – avoid hypokalaemia (risk of digitalis toxicity) – avoid hypomagnesaemia (risk of digitalis toxicity) – avoid hypoxia (risk of digitalis toxicity) – severe respiratory disease – sick sinus syndrome – thyroid disease

**INTERACTIONS**
Appendix 1: digoxin

**SIDE-EFFECTS**
- Common or very common: Arrhythmias—blurred vision—conduction disturbances—diarrhoea—dizziness—eosinophilia—nausea—small dose—vomiting—yellow vision
- Uncommon: Depression
- Very rare: Anorexia—apathy—confusion—fatigue—gynaecomasia on long-term use—headache—intestinal ischaemia and necrosis—psychosis—thrombocytopenia—weakness

**OVERDOSE**
If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

**Pregnancy**
May need dosage adjustment.

**Breast Feeding**
Amount too small to be harmful.

**Renal Impairment**
Use half normal dose if estimated glomerular filtration rate is 10–50 mL/minute/1.73 m² and use a quarter normal dose if estimated glomerular filtration rate is less than 10 mL/minute/1.73 m². Monitor plasma–digoxin concentration in renal impairment.

**MONITORING REQUIREMENTS**
- For plasma–digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- Plasma–digoxin concentration should be maintained in the range 0.8–2 micrograms/litre.
- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion, dilute with Sodium Chloride 0.9% or Glucose 5% to a max. concentration of 62.5 micrograms/mL; loading doses should be given over 30–60 minutes and maintenance dose over 10–20 minutes.
- With oral use: For oral administration, oral solution must not be diluted.

**PATIENT AND CARER ADVICE**
Patient counselling is advised for digoxin elixir (use pipette).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special–order manufacturers include: oral suspension, oral solution, solution for injection.

**Tablet**
- **Digoxin (Non-proprietary)**
  - **Digoxin 6.25 microgram**

2 **Bleeding disorders**

**Antifibrinolytic drugs and haemostatics**

**Overview**
Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemøma) and in the management of menorrhagia; it may also be used in hereditary angioedema, epistaxis, and thrombolytic overdose. Tranexamic acid can also be used in cardiac surgery to reduce blood loss and to reduce the need for use of blood products.

Desmopressin p. 412 is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

**ANTIFAEBRRHAGICS > ANTIFIBRINOLYTICS**

**Tranexamic acid**

<table>
<thead>
<tr>
<th><strong>INDICATIONS AND DOSE</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inhibition of fibrinolysis</strong></td>
</tr>
<tr>
<td>- By MOUTH</td>

</tr>
</tbody>
</table>

**Menorrhagia**

| - By MOUTH |
| - Child 12–17 years: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day |

**Hereditary angioedema**

| - By MOUTH |
| - Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g), for short–term prophylaxis of hereditary angioedema, tranexamic acid is started several days |
before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

- **BY SLOW INTRAVENOUS INJECTION**
- Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
- **BY CONTINUOUS INTRAVENOUS INFUSION**
- Child: 45 mg/kg, dose to be given over 24 hours

**Prevention of excessive bleeding after dental procedures (e.g. in haemophilia)**

- **BY INTRAVENOUS INJECTION**
- Child 6–17 years: 10 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively

- **BY MOUTH**
- Child 6–17 years: 15–25 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively, then 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g) for up to 8 days, dose to be given postoperatively

**Prevention of excessive bleeding after dental procedures (e.g. in haemophilia) with mouthwash 5% solution (specialist use only)**

- **BY MOUTH**
- Child 6–17 years: 5–10 mL 4 times a day for 2 days, rinse mouth with solution; the solution should not be swallowed

**Reduction of blood loss during cardiac surgery**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Child: (consult local protocol)

### UNLICENSED USE
Not licensed for reduction of blood loss during cardiac surgery; injection not licensed for use in children under 1 year or for administration by intravenous infusion.

### CONTRA-INDICATIONS
Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) • history of convulsions • thromboembolic disease

### CAUTIONS
Irregular menstrual bleeding (establish cause before initiating therapy) • massive haematuria (avoid if risk of ureteric obstruction) • patients receiving oral contraceptives (increased risk of thrombosis)

### CAUTIONS, FURTHER INFORMATION
Menorrhagia • Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

### INTERACTIONS
- **AXIS**
- Tranexamic acid 

### SIDE-EFFECTS

- **COMMON OR VERY COMMON**
  - Diarrhoea (reduce dose) • nausea • vomiting
- **UNCOMMON**
  - Dermatitis
- **RARE**
  - Impairment of colour vision (discontinue) • thromboembolic events • visual disturbances (discontinue)
- **FREQUENCY NOT KNOWN**
  - Convulsions (usually with high doses) • hypotension (on rapid intravenous injection) • malaise (on rapid intravenous injection)

### PREGNANCY
No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risks—crosses the placenta.

### BREAST FEEDING
Small amount present in milk—antifibrinolytic effect in infant unlikely.

### RENAL IMPAIRMENT
Reduce dose in mild to moderate impairment. Avoid in severe impairment.

### MONITORING REQUIREMENTS
Regular liver function tests in long-term treatment of hereditary angioedema.

### DIRECTIONS FOR ADMINISTRATION
For intravenous administration, dilute with Glucose 5% or Sodium chloride 0.9%.

### PATIENT AND CARER ADVICE

### 2.1 Coagulation factor deficiencies

#### BLOOD AND RELATED PRODUCTS

### COAGULATION PROTEINS

#### Dried prothrombin complex

(Human prothrombin complex)

### INDICATIONS AND DOSE

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available • Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

- **BY INTRAVENOUS INFUSION**
- **Child:** (consult haematologist)

### CONTRA-INDICATIONS
Angina • history of heparin induced thrombocytopenia • recent myocardial infarction • recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)

### CAUTIONS
Disseminated intravascular coagulation • history of myocardial infarction or coronary heart disease • postoperative use • risk of thrombosis • vaccination against hepatitis A and hepatitis B may be required

### SIDE-EFFECTS

- **RARE**
  - Headache
- **VERY RARE**
  - Anaphylaxis • antibody formation • hypersensitivity reactions • pyrexia
- **FREQUENCY NOT KNOWN**
  - Disseminated intravascular coagulation • nephrotic syndrome • thrombotic events

### HEPATIC IMPAIRMENT
Monitor closely in hepatic impairment (risk of thromboembolic complications).

### PRESCRIBING AND DISPENSING INFORMATION
Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X. Available from CSL Behring (Beriplex® P/N), Octapharma (Octaplex®).
**Factor IX fraction, dried**

- **INDICATIONS AND DOSE**
  - Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)
  - Intravenous infusion
  - Child: (consult haematologist)

- **CONTRA-INDICATIONS**
  - Disseminated intravascular coagulation

- **CAUTIONS**
  - Risk of thrombosis—principally with former low purity products - vaccination against hepatitis A and hepatitis B may be required (not necessary with recombinant preparation)

- **SIDE-EFFECTS**
  - Allergic reactions - chills - dizziness - fever - gastro-intestinal disturbances - headache

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for injection**
    - **AlphaNine** (Grifols UK Ltd)
      - Factor IX high purity 1000 unit: 1 vial £390.00
      - Factor IX high purity 1500 unit: 1 vial £500.00

    - **Haemonine** (Biostat UK Ltd)
      - Factor IX high purity 500 unit: 1 vial £255.00 (Hospital only)
      - Factor IX high purity 1000 unit: 1 vial £510.00 (Hospital only)

    - **Mononine** (CSL Behring UK Ltd)
      - Factor IX high purity 1000 unit: Mononine 1,000 unit powder and solvent for injection vials: 1 vial £478.43

    - **Replene-VF** (Bio Products Laboratory Ltd)
      - Factor IX high purity 500 unit: 1 vial £180.00
      - Factor IX high purity 1000 unit: 1 vial £360.00

  - **Powder and solvent for solution for infusion**
    - **BeneFIX** (Pfizer Ltd)
      - Nonacog alfa 250 unit: BeneFIX 250 unit powder and solvent for infusion vials: 1 vial £151.80 (Hospital only)
      - Nonacog alfa 500 unit: BeneFIX 500 unit powder and solvent for solution for infusion vials: 1 vial £303.60 (Hospital only)
      - Nonacog alfa 1000 unit: BeneFIX 1,000 unit powder and solvent for solution for infusion vials: 1 vial £607.20 (Hospital only)
      - Nonacog alfa 2000 unit: BeneFIX 2,000 unit powder and solvent for solution for infusion vials: 1 vial £1,214.40 (Hospital only)
      - Nonacog alfa 3000 unit: BeneFIX 3,000 unit powder and solvent for solution for infusion vials: 1 vial £1,821.60 (Hospital only)

**Factor VIIa (recombinant)**

- **INDICATIONS AND DOSE**
  - Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann’s thrombasthenia
    - Intravenous injection
    - Child: (consult haematologist)

- **CAUTIONS**
  - Disseminated intravascular coagulation - risk of thrombosis

- **SIDE-EFFECTS**
  - Very rare: Allergic reactions - cerebrovascular accident - coagulation disorders - fever - myocardial infarction - nausea - pain - rash - thrombotic events

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for injection**
    - **NovoSeven** (Novo Nordisk Ltd)
      - Eptacog alfa activated: 30000 unit: NovoSeven 1 mg (50 units) powder and solvent for injection pre-filled syringes: 1 vial £525.20 (Hospital only)
      - Eptacog alfa activated: 100000 unit: NovoSeven 2 mg (100 units) powder and solvent for injection vials: 1 vial £1,050.40 (Hospital only)
      - Eptacog alfa activated: 250000 unit: NovoSeven 5 mg (250 units) powder and solvent for injection pre-filled syringes: 1 vial £2,626.00 (Hospital only)
      - Eptacog alfa activated: 400000 unit: NovoSeven 8 mg (400 units) powder and solvent for injection vials: 1 vial £4,201.60 (Hospital only)

**Factor VIII fraction, dried**

- **INDICATIONS AND DOSE**
  - Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency / Von Willebrand’s disease
    - Intravenous injection
    - Child: (consult haematologist)

- **CAUTIONS**
  - Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates - vaccination against hepatitis A and hepatitis B may be required (not necessary with recombinant preparation)

- **SIDE-EFFECTS**

- **MONITORING REQUIREMENTS**
  - Monitor for development of factor VIII inhibitors.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dried factor VIII fraction is prepared from human plasma by a suitable
fractionation technique; it may also contain varying amounts of von Willebrand factor. Optipack®, Fanhdi®, and Octanate® are not indicated for use in von Willebrand's disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand's disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- Advate (Baxalta UK Ltd)
  - Octocog alfa 250 unit: Advate 250 unit powder and solvent for solution for injection vials | 1 vial | £118.57 (Hospital only)
  - Octocog alfa 500 unit: Advate 500 unit powder and solvent for solution for injection vials | 1 vial | £237.15

  - Simoctocog alfa 250 unit: Nuwig 250 unit powder and solvent for solution for injection vials | 1 vial | £190.00 (Hospital only)

Factor XIII fraction, dried

(Human fibrin-stabilising factor, dried)

INDICATIONS AND DOSE

Congenital Factor XIII deficiency

- By intravenous injection, or by intravenous infusion
- Child: (consult haematologist)

CAUTIONS

Vaccination against hepatitis A and hepatitis B may be required.

SIDE-EFFECTS

Rare: Allergic reactions - fever

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- Advate (Baxalta UK Ltd)
  - Octocog alfa 1500 unit: Advate 1500 unit powder and solvent for solution for infusion vials | 1 vial | £380.00 (Hospital only)
  - Octocog alfa 3000 unit: Advate 3000 unit powder and solvent for solution for infusion vials | 1 vial | £760.00 (Hospital only)

- Kogenate (Bayer Plc)
  - Octocog alfa 3000 unit: Kogenate Bayer 3000 unit powder and solvent for solution for injection vials | 1 vial | £1,520.00 (Hospital only)

Factor XIII 250 unit

Fibrogammin P (CSL Behring UK Ltd)

Factor XIII 250 unit: Fibrogammin P 250 unit powder and solvent for solution for injection vials | 1 vial | £90.59

Factor XIII 1250 unit: Fibrogammin P 1250 unit powder and solvent for solution for injection vials | 1 vial | £452.95

Fibrinogen, dried

(Human fibrinogen)

INDICATIONS AND DOSE

Treatment of haemorrhage in congenital hypofibrinogenaeoma or afibrinogenaeoma

- By intravenous injection, or by intravenous infusion
- Child: (consult haematologist)

CAUTIONS

Risk of thrombosis

SIDE-EFFECTS

Rare: Allergic reactions - fever

Very rare: Myocardial infarction - pulmonary embolism - thromboembolic events

PREGNANCY

Manufacturer advises not known to be harmful—no information available.

BREAST FEEDING

Manufacturer advises avoid—no information available.

PRESCRIBING AND DISPENSING INFORMATION

Fibrinogen is prepared from human plasma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Riastap (CSL Behring UK Ltd)
  - Fibrinogen 1 gram: Riastap 1g powder for solution for infusion vials | 1 vial | £340.00
Protein C concentrate

**INDICATIONS AND DOSE**

Congenital protein C deficiency

- BY INTRAVENOUS INJECTION
- Child: (consult haematologist)

**CAUTIONS**

Hypersensitivity to heparins; vaccination against hepatitis A and hepatitis B may be required

**SIDE-EFFECTS**

- Very rare: Bleeding, dizziness, fever, hypersensitivity reactions

**PRESCRIBING AND DISPENSING INFORMATION**

Protein C is prepared from human plasma.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Ceprotin (Baxalta UK Ltd)
    - Protein C 500 unit: Ceprotin 500 unit powder and solvent for solution for injection vials | 1 vial (P=3) no price available
    - Protein C 1000 unit: Ceprotin 1000 unit powder and solvent for solution for injection vials | 1 vial (P=3) no price available

**BLOOD AND RELATED PRODUCTS ➔ PLASMA PRODUCTS**

Fresh frozen plasma

**INDICATIONS AND DOSE**

Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

- BY INTRAVENOUS INFUSION
- Child: (consult haematologist)

**CONTRA-INDICATIONS**

Avoid use as a volume expander

**CAUTIONS**

Cardiac decompensation; need for compatibility; pulmonary oedema; severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®); vaccination against hepatitis A and hepatitis B may be required

**SIDE-EFFECTS**

- Common or very common: Nausea, pruritus, rash
- Uncommon: Oedema, vomiting
- Rare: Agitation, allergic reactions, bronchospasm, cardiorespiratory collapse, chills, fever, tachycardia
- Very rare: Arrhythmia, hypertension, thromboembolism

**PRESCRIBING AND DISPENSING INFORMATION**

Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®).

Children under 16 years should only receive virucidally inactivated preparations of fresh frozen plasma, sourced from ‘low prevalence BSE regions’ such as the USA.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines listed.

### 2.2 Subarachnoid haemorrhage

**CALCIUM-CHANNEL BLOCKERS**

Nimodipine

**DRUG ACTION**

Nimodipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

Treatment of vasospasm following subarachnoid haemorrhage (specialist use only)

- BY INTRAVENOUS INFUSION
- Child 1 month–11 years: Initially 15 micrograms/kg/hour (max. per dose 500 micrograms/hour), increased after 2 hours if no severe decrease in blood pressure; increased to 30 micrograms/kg/hour (max. per dose 2 mg/hour), continue for at least 5 days (max. 14 days), use initial dose of 7.5 micrograms/kg/hour if blood pressure unstable
- Child 12–17 years (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)
- Child 12–17 years (body-weight 70 kg and above): Initially up to 1 mg/hour, use dose if blood pressure stable; increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)
**Fibrinolytics**

- **Drug Action** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

- **Contra-Indications** Acute pancreatitis, aneurysm, arteriovenous malformation, bacterial endocarditis, bleeding diatheses, coagulation defects, neoplasm with risk of haemorrhage, pericarditis, recent haemorrhage, recent surgery (including dental extraction), recent trauma, severe hypertension.

- **Caution** Conditions with an increased risk of haemorrhage, hypertension, risk of bleeding (including that from venepuncture or invasive procedures).

- **Side-Effects** Allergic reactions, anaphylaxis, back pain, bleeding (usually limited to the site of injection, but can occur from other sites), cerebral oedema (caused by reperfusion), convulsions, fever, flushing, hypotension, intracerebral haemorrhage, nausea, pulmonary oedema (caused by reperfusion), rash, uveitis, vomiting.

**Side-Effects, Further Information**

- **Bleeding** Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).

- **Hypotension** Hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.

- **Pregnancy** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

- **Hepatic Impairment** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

### Alteplase

- **Indications and Dose**
  - **Intravenous Thrombosis**
    - Neonate: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment (consult local protocol).
    - Child: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment; maximum 100 mg per day.
  - **ACTILYSE CATHFLO®**
    - Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)
      - **By Intravenous Injection**
        - Child: (consult product literature)
Blood clots

- **UNLICENSED USE** Actilyse® not licensed for use in children.
- **CONTRA-INDICATIONS** Oesophageal varices • recent delivery • recent ulcerative gastro-intestinal disease • stroke
- **INTERACTIONS** → Appendix 1: alteplase
- **SIDE-EFFECTS** Risk of cerebral bleeding increased in acute stroke
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Actilyse®), dissolve in Water for Injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute further in Sodium Chloride 0.9% to a concentration of not less than 200 micrograms/mL; not to be diluted in Glucose.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection Powder and solvent for solution for injection
  - Actilyse (Boehringer Ingelheim Ltd)
    - Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial £172.80
    - Alteplase 20 mg Actilyse 20mg powder and solvent for solution for injection vials | 1 vial £259.20
  - Actilyse Cathflo (Boehringer Ingelheim Ltd)
    - Alteplase 2 mg Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vials £225.00 (Hospital only)
Powder and solvent for solution for infusion
  - Actilyse (Boehringer Ingelheim Ltd)
    - Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial £432.00

Streptokinase

- **INDICATIONS AND DOSE** Intravascular thrombosis
  - **INITIALLY BY INTRAVENOUS INFUSION**
    - Child 1 month–11 years: Initially 2500–4000 units/kg, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 500–1000 units/kg/hour for up to 3 days until reperfusion occurs
    - Child 12–17 years: Initially 250 000 units, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 100 000 units/hour for up to 3 days until reperfusion occurs

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid in children who have had streptococcal infection in the last 12 months
- **CAUTIONS** Atrial fibrillation • cavernous pulmonary disease • cerebrovascular disease • mitral valve defect • recent delivery or abortion • septic thrombotic disease
- **INTERACTIONS** → Appendix 1: streptokinase
- **SIDE-EFFECTS** Rare Guillaume–Barré syndrome
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute with Sodium Chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution. Monitor fibrinogen concentration closely; if fibrinogen concentration less than 1 g/litre, stop streptokinase infusion and start unfractionated heparin; restart streptokinase once fibrinogen concentration reaches 1 g/litre.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Urokinase

- **INDICATIONS AND DOSE** Occluded arteriovenous shunts, catheters, and indwelling central lines
  - **TO THE DEVICE AS A FLUSH**
    - Neonate: 5000–25 000 units, inject directly into occluded catheter or central line, dilute dose in sodium chloride 0.9% to fill catheter dead space only. Leave for 20–60 minutes then aspirate the lyysate and flush with sodium chloride 0.9%.
    - Child: 5000–25 000 units, inject directly into occluded catheter or central line, dilute dose in sodium chloride 0.9% to fill catheter dead space only. Leave for 20–60 minutes then aspirate the lysate and flush with sodium chloride 0.9%

- **CONTRA-INDICATIONS** Recent stroke
- **CAUTIONS** Atrial fibrillation • cavernous pulmonary disease • mitral valve defect • recent delivery • septic thrombotic disease • severe cerebrovascular disease
- **INTERACTIONS** → Appendix 1: urokinase
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** May be diluted, after reconstitution, with Sodium Chloride 0.9%.

- **UNLICENSED USE** Not licensed for use in children.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection Powder and solvent for solution for injection
  - Urokinase (Non-proprietary)
    - Urokinase 10000 unit Urokinase 10,000 unit powder for solution for injection vials | 1 vial £33.79
    - Urokinase 50000 unit Urokinase 50,000 unit powder for solution for injection vials | 1 vial £69.70
    - Urokinase 100000 unit Urokinase 100,000 unit powder for solution for injection vials | 1 vial £106.17
    - Urokinase 250000 unit Urokinase 250,000 unit powder for solution for injection vials | 1 vial £185.65
    - Urokinase 5000000 unit Urokinase 500,000 unit powder for solution for injection vials | 1 vial £365.00
  - Syner-KINASE (Syner-Med Pharmaceutical Products Ltd)
    - Syner-KINASE 10000 unit Syner-KINASE 10,000 unit powder for solution for injection vials | 1 vial £35.95 (Hospital only)
    - Syner-KINASE 25000 unit Syner-KINASE 25,000 unit powder for solution for injection vials | 1 vial £45.95 (Hospital only)
    - Syner-KINASE 100000 unit Syner-KINASE 100,000 unit powder for solution for injection vials | 1 vial £112.95 (Hospital only)
    - Syner-KINASE 250000 unit Syner-KINASE 250,000 unit powder for solution for injection vials | 1 vial no price available (Hospital only)
    - Syner-KINASE 5000000 unit Syner-KINASE 500,000 unit powder for solution for injection vials | 1 vial no price available (Hospital only)
3.2 Thromboembolism

Venous thromboembolism

Prophylaxis of venous thromboembolism
Low-dose heparin (unfractionated) p. 92 by subcutaneous injection is used to prevent thrombotic episodes in ‘high-risk’ patients; laboratory monitoring of APTT or anti-Factor Xa concentration is also required in prophylactic regimens in children. Low molecular weight heparins, aspirin (antiplatelet dose), and warfarin sodium p. 94 can also be used for prophylaxis.

Treatment of venous thromboembolism
For the initial treatment of thrombotic episodes heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection; the use of intermittent intravenous injection is no longer recommended. Alternatively, a low molecular weight heparin may be given for initial treatment. If an oral anticoagulant (usually warfarin sodium) is also required, it may be started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring of coagulation activity, preferably on a daily basis, involves determination of the activated partial thromboplastin time (APTT) (for heparin (unfractionated) only) or of the anti-Factor Xa concentration (for low molecular weight heparins). Local guidelines on recommended APTT for neonates and children should be followed; monitoring of APTT should be discussed with a specialist prior to treatment for thrombotic episodes in neonates.

Management of venous thromboembolism in pregnancy
Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 91, enoxaparin sodium p. 92 and tinzaparin sodium p. 93; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits
Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage
If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin (unfractionated), but if rapid reversal of the effects of the heparin (unfractionated) is required, protamine sulfate p. 812 is a specific antidote (but only partially reverses the effects of low molecular weight heparin (unfractionated)).

Oral anticoagulants

Overview
The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Oral anticoagulants antagonise the effects of vitamin K and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

Uses
Warfarin sodium p. 94 is the drug of choice for the treatment of systemic thromboembolism in children (not neonates) after initial heparinisation. It may also be used occasionally for the treatment of intravascular or intracardiac thrombi. Warfarin sodium is used prophylactically in those with chronic atrial fibrillation, dilated cardiomyopathy, certain forms of reconstructive heart surgery, mechanical prosthetic heart valves, and some forms of hereditary thrombophilia (e.g. homozygous protein C deficiency).

Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 88) is usually preferred for the prophylaxis of venous thromboembolism in children undergoing surgery; alternatively warfarin sodium can be continued in selected children currently taking warfarin sodium and who are at a high risk of thromboembolism (seek expert advice).

Dose
The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

An induction dose is usually given over 4 days. The subsequent maintenance dose depends on the prothrombin time, reported as INR (international normalised ratio) and should be taken at the same time each day.

Target INR

- An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:
- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction
INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;
  - Mechanical prosthetic heart valves:
- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Haemorrhage
The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:
- Major bleeding—stop warfarin sodium; give phytomenadione (vitamin K₃) p. 609 by slow intravenous injection; give dried prothrombin complex p. 81 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₃) by slow intravenous injection; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K₃) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₃) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Parenteral anticoagulants

Anticoagulants
Although thrombotic episodes are uncommon in childhood, anticoagulants may be required in children with congenital heart disease; in children undergoing haemodialysis; for preventing thrombosis in children requiring chemotherapy and following surgery; and for systemic venous thromboembolism secondary to inherited thrombophilias, systemic lupus erythematosus, or indwelling central venous catheters.

Heparin
Heparin initiates anticoagulation rapidly but has a short duration of action. It is now often referred to as being standard or heparin (unfractionated) p. 92 to distinguish it from the low molecular weight heparins, which have a longer duration of action. For children at high risk of bleeding, heparin (unfractionated) is more suitable than low molecular weight heparin because its effect can be terminated rapidly by stopping the infusion.

Heparins are used in both the treatment and prophylaxis of thromboembolic disease, mainly to prevent further clotting rather than to lyse existing clots—surgery or a thrombolytic drug may be necessary if a thrombus obstructs major vessels.

Low molecular weight heparins
Dalteparin sodium p. 91, enoxaparin sodium p. 92, and tinzaparin sodium p. 93 are low molecular weight heparins used for treatment and prophylaxis of thrombotic episodes in children. Their duration of action is longer than that of heparin (unfractionated) and in adults and older children once-daily subcutaneous dosage is sometimes possible; however, younger children require relatively higher doses (possibly due to larger volume of distribution, altered heparin pharmacokinetics, or lower plasma concentrations of antithrombin) and twice daily dosage is sometimes necessary. Low molecular weight heparins are convenient to use, especially in children with poor venous access.

Heparinoids
Danaparoid sodium p. 90 is a heparinoid that has a role in children who develop heparin-induced thrombocytopenia, providing they have no evidence of cross-reactivity.

Heparin flushes
The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol
Epoprostenol (prostacyclin) p. 115 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is a potent vasodilator and therefore its side-effects include flushing, headache and hypotension.

Other drugs used for Thromboembolism
Alteplase, p. 85 • Streptokinase, p. 86

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Antiplatelet drugs

Overview
Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Aspirin p. 89 has limited use in children because it has been associated with Reye’s syndrome. Aspirin-containing preparations should not be given to children and adolescents under 16 years, unless specifically indicated, such as for Kawasaki disease, for prophylaxis of clot formation after cardiac surgery, or for prophylaxis of stroke in children at high risk.

If aspirin causes dyspepsia, or if the child is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor or a H₂-receptor antagonist can be added.

Dipyridamole p. 90 is also used as an antiplatelet drug to prevent clot formation after cardiac surgery and may be used with specialist advice for treatment of persistent coronary artery aneurysms in Kawasaki disease.
Kawasaki disease
Initial treatment is with high dose aspirin and a single dose of intravenous normal immunoglobulin; this combination has an additive anti-inflammatory effect resulting in faster resolution of fever and a decreased incidence of coronary artery complications. After the acute phase, when the patient is afebrile, aspirin is continued at a lower dose to prevent coronary artery abnormalities.

Aspirin

(Acetylsalicylic Acid)

- **INDICATIONS AND DOSE**
  - **Antplatelet** | Prevention of thrombus formation after cardiac surgery
    - **BY MOUTH**
    - Neonate: 1–5 mg/kg once daily.
    - Child 1 month–11 years: 1–5 mg/kg once daily (max. per dose 75 mg)
    - Child 12–17 years: 75 mg once daily
  
  - Kawasaki disease
    - **BY MOUTH**
    - Neonate: Initially 8 mg/kg 4 times a day for 2 weeks or until afebrile, followed by 5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice.
    - Child 1 month–11 years: Initially 7.5–12.5 mg/kg 4 times a day for 2 weeks or until afebrile, then 2–5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice.

- **UNLICENSED USE** Not licensed for use in children under 16 years.
- **CONTRA-INDICATIONS**
  - Active peptic ulceration - bleeding disorders (antplatelet dose) - children under 16 years (risk of Reye's syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)
  
  **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Reye's syndrome Owing to an association with Reye's syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

- **CAUTIONS** Allergic disease - anaemia - asthma - dehydration - G6PD deficiency - preferably avoid during fever or viral infection in children (risk of Reye's syndrome) - previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) - thyrotoxicosis - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: aspirin

- **SIDE-EFFECTS** Blood disorders (with analgesic doses) - bronchospasm - confusion (with analgesic doses) - gastrointestinal haemorrhage (occasionally major) - gastrointestinal irritation (with slight asymptomatic blood loss at higher doses) - haemorrhage including subconjunctival haemorrhage (reported with antplatelet doses) - increased bleeding time - skin reactions in hypersensitive patients - tinnitus (with analgesic doses)

- **OVERDOSAGE**
  - The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

  For specific details on the management of poisoning, see **Aspirin**, under Emergency treatment of poisoning p. 803.
**Dipyridamole**

**INDICATIONS AND DOSE**

> Kawasaki disease (initiated under specialist supervision)
> - By mouth using immediate-release medicines
>  - Child 1 month–11 years: 1 mg/kg 3 times a day

> Prevention of thrombus formation after cardiac surgery
> - By mouth using immediate-release medicines
>  - Child 1 month–11 years: 2.5 mg/kg twice daily
>  - Child 12–17 years: 100–200 mg 3 times a day

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation)

**INTERACTIONS** → Appendix 1: dipyridamole

**SIDE-EFFECTS** Angioedema · dizziness · gastro-intestinal effects · hot flushes · hypersensitivity reactions · hypotension · increased bleeding after surgery · increased bleeding during surgery · myalgia · rash · severe bronchospasm · tachycardia · throbbing headache · thrombocytopenia · urticaria

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Manufacturers advise use only if essential—small amount present in milk.

**DIRECTIONS FOR ADMINISTRATION** Injection solution can be given orally.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

> Dipyridamole (Non-proprietary)
>  - Dipyridamole 10 mg per 1 ml  Dipyridamole 50mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £41.06 DT price = £41.06
>  - Dipyridamole 40 mg per 1 ml  Dipyridamole 200mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £122.78–£133.53 DT price = £133.53

**Tablet**

CAUTIONARY AND ADVISORY LABELS 22

> Dipyridamole (Non-proprietary)
>  - Dipyridamole 25 mg  Dipyridamole 25mg tablets | 84 tablet [PoM] £9.40 DT price = £9.40
>  - Dipyridamole 100 mg  Dipyridamole 100mg tablets | 84 tablet [PoM] £12.50 DT price = £4.07
>  - Persamin (Boehringer Ingelheim Ltd)
>    - Dipyridamole 50 mg  Persamin 100mg tablets | 84 tablet [PoM] £6.30 DT price = £4.07

**ANTITHROMBOTIC DRUGS > HEPARINOIDS**

**Danaparoid sodium**

**INDICATIONS AND DOSE**

> Thromboembolic disease in patients with history of heparin-induced thrombocytopenia
>  - Initially by intravenous injection

> Neonate: Initially 30 units/kg, then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity.

> Child 1 month–15 years (body-weight up to 55 kg): Initially 30 units/kg (max. per dose 1250 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity.

> Child 1 month–15 years (body-weight 55 kg and above): Initially 30 units/kg (max. per dose 2500 units), then (by continuous intravenous infusion)

> 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity.

> Child 16–17 years (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity.

> Child 16–17 years (body-weight 55–90 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity.

> Child 16–17 years (body-weight 91 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity.

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

**CAUTIONS** Antibodies to heparins (risk of antibody-induced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding.

**INTERACTIONS** → Appendix 1: danaparoid

**SIDE-EFFECTS** Bleeding · hypersensitivity reactions · rash

**PREGNANCY** Manufacturer advises avoid—limited information available but not known to be harmful.

**BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

**RENAL IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available. Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

**MONITORING REQUIREMENTS** Monitor anti factor Xa activity in patients with body-weight over 90 kg.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

> Danaparoid sodium (Non-proprietary)
>  - Danaparoid sodium 1250 unit per 1 ml  Danaparoid sodium 750units/0.6ml solution for injection ampoules | 10 ampoule [PoM] £599.99

**ANTITHROMBOTIC DRUGS > HEPARINS**

**Heparins**

**CONTRA-INDICATIONS** Acute bacterial endocarditis · after major trauma · epidural anaesthesia with treatment doses · haemophilia and other haemorrhagic disorders · peptic
ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · severe hypertension · spinal anaesthesia with treatment doses · thrombocytopenia (including history of heparin-induced thrombocytopenia)

**SIDE-EFFECTS**
- Rare: Alopecia (on prolonged use) · anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · osteoporosis (risk lower with low molecular weight heparins) · priapism · rebound hyperlipidaemia (following unfraccionated heparin withdrawal) · skin necrosis · urticaria
- Frequency not known: Haemorrhage · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Haemorrhage: If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).
- Heparin-induced thrombocytopenia: Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis.
- Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.
- Hyperkalaemia: Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.
- Allergy and cross-sensitivity: Hypersensitivity to unfractionated or low molecular weight heparin.
- Monitoring requirements: Heparin-induced thrombocytopenia: Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 3 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 528–540.
- Hyperkalaemia: Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

### Dalteparin sodium

#### INDICATIONS AND DOSE
**Treatment of thrombotic episodes**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg twice daily.
  - Child 1 month–11 years: 100 units/kg once daily.
  - Child 12–17 years: 2500–5000 units once daily.

### Treatment of venous thromboembolism in pregnancy
- **BY SUBCUTANEOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose.
  - Child 12–17 years (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose.
  - Child 12–17 years (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose.
  - Child 12–17 years (body-weight 90 kg and above): 10000 units twice daily, use body-weight in early pregnancy to calculate the dose.

**Prophylaxis of thrombotic episodes.**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg once daily.
  - Child 1 month–11 years: 100 units/kg once daily.
  - Child 12–17 years: 2500–5000 units once daily.

#### UNLICENSED USE

#### INTERACTIONS
- Appendix 1: low molecular-weight heparins

#### PREGNANCY
Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

#### BREAST FEEDING
Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

#### HEPATIC IMPAIRMENT
Dose reduction may be required in severe impairment—risk of bleeding may be increased.

#### RENAL IMPAIRMENT
Risk of bleeding may be increased—dose reduction may be required. Use of unfraccionated heparin may be preferable.

#### MONITORING REQUIREMENTS
Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection
**Excipients:** May contain Benzyl alcohol
- Dalteparin sodium (Non-proprietary)
  - Dalteparin sodium 10000 unit per 1 ml
  - Dalteparin sodium 10,000 units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) no price available DT price = £28.23 | 5 pre-filled disposable injection no price available DT price = £28.23
  - Dalteparin sodium 12500 unit per 1 ml
  - Dalteparin sodium 2,500 units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) no price available DT price = £18.58
  - Dalteparin sodium 25000 unit per 1 ml
  - Dalteparin sodium 7,500 units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) no price available DT price = £42.34
  - Dalteparin sodium 12,500 units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) no price available DT price = £35.29
  - Dalteparin sodium 5,000 units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) no price available DT price = £28.23
  - Dalteparin sodium 15,000 units/0.6ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) no price available DT price = £42.34
  - Dalteparin sodium 10,000 units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) no price available DT price = £28.23
Daltaparin sodium 18,000 units/0.72 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) no price available DT price = £50.82
- Fragmin (Pfizer Ltd)
  - Daltaparin sodium 2500 unit per 1 ml Fragmin 10,000 units/4 ml solution for injection ampoules | 10 ampoule (PDP) £51.22
  - Daltaparin sodium 10,000 unit per 1 ml Fragmin 10,000 units/1 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) £28.23 DT price = £28.23
  - Fragmin 10,000 units/1 ml solution for injection ampoules | 10 ampoule (PDP) £51.22
  - Daltaparin sodium 12,500 unit per 1 ml Fragmin 2,500 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £18.58 DT price = £18.58
- Daltaparin sodium 25,000 unit per 1 ml Fragmin 18,000 units/0.72 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) £50.82 DT price = £50.82
  - Fragmin 15,000 units/0.6 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) £42.34 DT price = £42.34
  - Fragmin 5,000 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £28.23 DT price = £28.23
  - Fragmin 12,500 units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) £35.29 DT price = £35.29
  - Fragmin 7,500 units/0.3 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £42.34 DT price = £42.34
  - Fragmin 100,000 units/4 ml solution for injection vials | 1 vial (PDP) £48.66
  - Fragmin 10,000 units/0.4 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PDP) £28.23 DT price = £28.23

**Enoxaparin sodium**

- **INDICATIONS AND DOSE**
  - **Treatment of thrombotic episodes**
    - **BY SUBCUTANEOUS INJECTION**
      - Neonate: 1.5–2 mg/kg twice daily.
      - Child 1 month: 1.5 mg/kg twice daily
      - Child 2 months–17 years: 1 mg/kg twice daily

  - **Treatment of venous thromboembolism in pregnancy**
    - **BY SUBCUTANEOUS INJECTION**
      - Child 12–17 years (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
      - Child 12–17 years (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
      - Child 12–17 years (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
      - Child 12–17 years (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

  - **Prophylaxis of thrombotic episodes**
    - **BY SUBCUTANEOUS INJECTION**
      - Neonate: 750 micrograms/kg twice daily.
      - Child 1 month: 750 micrograms/kg twice daily
      - Child 2 months–17 years: 500 micrograms/kg twice daily; maximum 40 mg per day

  - **DOSE EQUIVALENT AND CONVERSION**
    - 1 mg equivalent to 100 units.

- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of enoxaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.

- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment—risk of bleeding may be increased.
- **RENAL IMPAIRMENT** Risk of bleeding increased; reduce dose if estimated glomerular filtration rate less than 30 ml/minute/1.73 m²—consult product literature for details. Use of unfractionated heparin may be preferable.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **EXCIPIENTS:** May contain Benzyl alcohol
  - **Clexane (Sanofi)**
    - Enoxaparin sodium 100 mg per 1 ml Clexane 60 mg/0.6 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £39.26 DT price = £39.26
    - Clexane 300 mg/3 ml solution for injection multidose vials | 1 vial (PDP) £21.33
    - Clexane 80 mg/0.8 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £55.13 DT price = £55.13
    - Clexane 40 mg/0.4 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £30.27 DT price = £30.27
    - Clexane 100 mg/1 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £72.30 DT price = £72.30
    - Clexane 20 mg/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £20.86 DT price = £20.86
  - Enoxaparin sodium 150 mg per 1 ml Clexane Forte 120 mg/0.8 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £87.93 DT price = £87.93
    - Clexane Forte 150 mg/1 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PDP) £99.91 DT price = £99.91

**Heparin (unfractionated)**

- **INDICATIONS AND DOSE**
  - **Prevention of clotting in extracorporeal circuits**
    - TO THE DEVICE AS A FLUSH
    - Child: (consult product literature)
  - **Maintenance of neonatal umbilical arterial catheter**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 0.5 unit/hour.
  - **Treatment of thrombotic episodes**
    - **INITIALLY BY INTRAVENOUS INFUSION**
      - Neonate up to 35 weeks corrected gestational age: Initially 50 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.
      - Neonate: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.
    - Child 1–11 months: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT
    - Child 1–17 years: Initially 75 units/kg, then (by continuous intravenous infusion) 20 units/kg/hour, adjusted according to APTT
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 250 units/kg twice daily, adjusted according to APTT
  - **Prophylaxis of thrombotic episodes**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 100 units/kg twice daily (max. per dose 5000 units), adjusted according to APTT
  - **Maintenance of cardiac shunts and critical stents**
    - TO THE DEVICE AS A FLUSH
    - Child: (consult local protocol)
**Tinzaparin sodium**

**INDICATIONS AND DOSE**

**Treatment of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Child 1 month: 275 units/kg once daily
  - Child 2-11 months: 250 units/kg once daily
  - Child 1-4 years: 240 units/kg once daily
  - Child 5-9 years: 200 units/kg once daily
  - Child 10-17 years: 175 units/kg once daily

**Treatment of venous thromboembolism in pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: 175 units/kg once daily, dose based on early pregnancy body-weight

**Prophylaxis of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Child: 50 units/kg once daily

**UNLICENSED USE**

**INTERACTIONS**

- Appendix 1: low molecular-weight heparins

**SIDE-EFFECTS**

- Uncommon: Headache

**PREGNANCY**

Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

**BREAST FEEDING**

Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

**RENAL IMPAIRMENT**

Manufacturer advises caution if bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).

**HEPATIC IMPAIRMENT**

Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).

**DIRECTIONS FOR ADMINISTRATION**

For continued intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

In neonates: For maintenance of neonatal umbilical arterial catheter, dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour. For neonatal intensive care (treatment of thrombosis), dilute 1250 units/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Heparin (unfractionated) (Non-proprietary)**
  - Tinzaparin sodium 1000 unit per 1 ml
    - Heparin sodium 1,000 units/ml solution for injection ampoules: 10 ampoule £14.85
    - Heparin sodium 5,000 units/ml solution for injection vials: 10 vial (P)^9\$16.50–£37.41
  - Heparin sodium 20,000 units/20ml solution for injection ampoules: 10 ampoule (P) £70.80–£70.88
  - Heparin sodium 50,000 units/5ml solution for injection ampoules: 10 ampoule (P) £37.45–£37.47
  - Heparin sodium 10,000 units/10ml solution for injection ampoules: 10 ampoule (P) £64.50–£64.59
  - Heparin sodium 5000 unit per 1 ml
    - Heparin sodium 5,000 units/ml solution for injection ampoules: 10 ampoule (P) £29.04
    - Heparin sodium 25,000 units/5ml solution for injection vials: 10 vial (P) £45.00–£94.60
  - Heparin sodium 25,000 units/5ml solution for injection ampoules: 10 ampoule (P) £75.78
  - Heparin calcium 25000 unit per 1 ml
    - Heparin calcium 5,000 units/0.2ml solution for injection ampoules: 10 ampoule (P) £44.70
    - Heparin calcium 25,000 units/1ml solution for injection ampoules: 10 ampoule (P) £76.95
    - Heparin calcium 5,000 units/0.2ml solution for injection ampoules: 10 ampoule (P) £37.35

**Intravenous flush**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Heparin (unfractionated) (Non-proprietary)**
  - Tinzaparin sodium 10 unit per 1 ml
    - Heparin sodium 50 units/5ml patency solution ampoules: 10 ampoule (P) £14.96 DT price = £14.96
  - Heparin sodium 50 units/5ml L.V. flush solution ampoules: 10 ampoule (P) £14.96 DT price = £14.96
  - Heparin sodium 100 unit per 1 ml
    - Heparin sodium 200 units/2ml I.V. flush solution ampoules: 10 ampoule (P) £15.68 DT price = £15.68
    - Heparin sodium 200 units/2ml patency solution ampoules: 10 ampoule (P) £15.68 DT price = £15.68

**Infusion**

- **Heparin (unfractionated) (Non-proprietary)**
  - Heparin sodium 2 unit per 1 ml
    - Heparin sodium 1,000 units/500ml infusion Viaflex bags: 1 bag (P) no price available
    - Heparin sodium 2,000 units/1,000ml infusion Viaflex bags: 1 bag (P) no price available
  - Heparin sodium 5 unit per 1 ml
    - Heparin sodium 5,000 units/1litre infusion Viaflex bags: 1 bag (P) no price available

**BNFC 2017–2018**

**Cardiovascular system**
ANTITHROMBOTIC DRUGS

VITAMIN K ANTAGONISTS

**INNOCHEP 16,000 units/0.8ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £57.12 | 10 pre-filled disposable injection | £95.20**

**INNOCHEP 12,000 units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £42.84 | 10 pre-filled disposable injection | £71.40**

**INNOCHEP 14,000 units/0.7ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £49.98 | 10 pre-filled disposable injection | £83.30**

**INNOCHEP 10,000 units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £35.70 | 10 pre-filled disposable injection | £59.50**

**PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@spsl.co.uk. In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders.dppas@apsgroup.co.uk or by fax on (0131) 6299 967

Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

**Warfarin sodium**

**INDICATIONS AND DOSE**

**Treatment and prophylaxis of thrombotic episodes (induction)**

- **BY MOUTH**
  - Neonate (initiated under specialist supervision): Initially 200 micrograms/kg for 1 dose on day 1, then reduced to 100 micrograms/kg once daily for the following 3 days, subsequent doses dependent on INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3.
  - Child: Initially 200 micrograms/kg (max. per dose 10 mg) for 1 dose on day 1, then reduced to 100 micrograms/kg once daily (max. per dose 5 mg) for the following 3 days, subsequent doses adjusted according to INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3.

**Treatment and prophylaxis of thrombotic episodes following induction dose (if INR still below 1.4)**

- **BY MOUTH**
  - Neonate (under expert supervision): 200 micrograms/kg once daily.
  - Child: 200 micrograms/kg once daily (max. per dose 10 mg)

**Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.0)**

- **BY MOUTH**
  - Neonate (under expert supervision): 50 micrograms/kg once daily.
  - Child: 50 micrograms/kg once daily (max. per dose 2.5 mg)

**Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.5)**

- **BY MOUTH**
  - Neonate (under expert supervision): Dose to be omitted.
  - Child: Dose to be omitted
### Hypertension

#### Overview

Hypertension in children and adolescents can have a substantial effect on long-term health. Possible causes of hypertension (e.g. congenital heart disease, renal disease and endocrine disorders) and the presence of any complications (e.g. left ventricular hypertrophy) should be established. Treatment should take account of contributory factors and any factors that increase the risk of cardiovascular complications.

Serious hypertension is rare in neonates but it can present with signs of congestive heart failure; the cause is often renal and can follow embolic arterial damage.

Children (or their parents or carers) should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include weight reduction (in obese children), reduction of dietary salt, reduction of total and saturated fat, increasing exercise, increasing fruit and vegetable intake, and not smoking.

Indications for antihypertensive therapy in children include symptomatic hypertension, secondary hypertension, hypertensive target-organ damage, diabetes mellitus, persistent hypertension despite lifestyle measures, and pulmonary hypertension. The effect of antihypertensive treatment on growth and development is not known; treatment should be started only if benefits are clear.

Antihypertensive therapy should be initiated with a single drug at the lowest recommended dose; the dose can be increased until the target blood pressure is achieved. Once the highest recommended dose is reached, or sooner if the patient begins to experience side-effects, a second drug may be added if blood pressure is not controlled. If more than one drug is required, these should be given as separate products to allow dose adjustment of individual drugs, but fixed-dose combination products may be useful in adolescents if compliance is a problem.

Acceptable drug classes for use in children with hypertension include ACE inhibitors, alpha-blockers, beta-blockers, calcium-channel blockers, and thiazide diuretics. There is limited information on the use of angiotensin-II receptor antagonists in children. Diuretics and beta-blockers have a long history of safety and efficacy in children. The newer classes of antihypertensive drugs, including ACE inhibitors and calcium-channel blockers have been shown to be safe and effective in short-term studies in children. Refractory hypertension may require additional treatment with agents such as minoxidil p. 114 or clonidine hydrochloride p. 99.

#### Other measures to reduce cardiovascular risk

Aspirin p. 89 may be used to reduce the risk of cardiovascular events; however, concerns about an increased risk of bleeding and Reye’s syndrome need to be considered.

A statin can be of benefit in older children who have a high risk of cardiovascular disease and have hypercholesterolaemia.
Hypertension in diabetes
Hypertension can occur in type 2 diabetes and treatment prevents both macrovascular and microvascular complications. ACE inhibitors may be considered in children with diabetes and microalbuminuria or proteinuric renal disease. Beta-blockers are best avoided in children with, or at a high risk of developing, diabetes, especially when combined with a thiazide diuretic.

Hypertension in renal disease
ACE inhibitors may be considered in children with microalbuminuria or proteinuric renal disease. High doses of loop diuretics may be required. Specific cautions apply to the use of ACE inhibitors in renal impairment, but ACE inhibitors may be effective. Dihydropyridine calcium-channel blockers may be added.

Hypertension in pregnancy
High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. Methyldopa is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of nifedipine p. 106 [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of labetalol hydrochloride p. 101 can be used to control hypertensive crises; alternatively hydralazine hydrochloride p. 113 can be given by the intravenous route.

Hypertensive emergencies
Hypertensive emergencies in children may be accompanied by signs of hypertension encephalopathy, including seizures. Controlled reduction in blood pressure over 72–96 hours is essential; rapid reduction can reduce perfusion leading to organ damage. Treatment should be initiated with intravenous drugs; once blood pressure is controlled, oral therapy can be started. It may be necessary to infuse fluids particularly during the first 12 hours to expand plasma volume should the blood pressure drop too rapidly.

Controlled reduction of blood pressure is achieved by intravenous administration of labetalol hydrochloride or sodium nitroprusside p. 114. Esmolol hydrochloride p. 103 is useful for short-term use and has a short duration of action. Nicardipine hydrochloride p. 105 can be administered as a continuous intravenous infusion for life-threatening hypertension in paediatric intensive care settings. In less severe cases, nifedipine capsules can be used.

Other antihypertensive drugs which can be given intravenously include hydralazine hydrochloride and clonidine hydrochloride.

Hypertension in acute nephritis occurs as a result of sodium and water retention; it should be treated with sodium and fluid restriction, and with furosemide p. 136; antihypertensive drugs may be added if necessary.

Also see advice on short-term management of hypertensive episodes in phaeochromocytoma.

Phaeochromocytoma
Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred. There is no nationwide consensus on the optimal drug regimen or doses used for the management of phaeochromocytoma.

Phenoxybenzamine hydrochloride p. 114, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects.

Pulmonary hypertension
Only pulmonary arterial hypertension is currently suitable for drug treatment. Pulmonary arterial hypertension includes persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension in children, and pulmonary hypertension related to congenital heart disease and cardiac surgery.

Some types of pulmonary hypertension are treated with vasodilator antihypertensive therapy and oxygen. Diuretics may also have a role in children with right-sided heart failure.

Initial treatment of persistent pulmonary hypertension of the newborn involves the administration of nitric oxide; epoprostenol p. 115 can be used until nitric oxide is available. Oral sildenafil p. 117 may be helpful in less severe cases. Epoprostenol and sildenafil can cause profound systemic hypotension. In rare circumstances either tolazoline p. 117 or magnesium sulfate p. 571 can be given by intravenous infusion when nitric oxide and epoprostenol have failed.

Treatment of idiopathic pulmonary arterial hypertension is determined by acute vasodilator testing; drugs used for treatment include calcium-channel blockers (usually nifedipine), long-term intravenous epoprostenol, nebulised iloprost p. 116, bosentan p. 116, or sildenafil. Anticoagulation (usually with warfarin sodium p. 94) may also be required to prevent secondary thrombosis.

Inhaled nitric oxide is a potent and selective pulmonary vasodilator. It acts on cyclic guanosine monophosphate (cGMP) resulting in smooth muscle relaxation. Inhaled nitric oxide is used in the treatment of persistent pulmonary hypertension of the newborn, and may also be useful in other forms of arterial pulmonary hypertension. Dependency can occur with high doses and prolonged use; to avoid rebound pulmonary hypertension the drug should be withdrawn gradually, often with the aid of sildenafil p. 117.

Excess nitric oxide can cause methaemoglobinemia; therefore, methaemoglobin concentration should be measured regularly, particularly in neonates.

Nitric oxide increases the risk of haemorrhage by inhibiting platelet aggregation, but it does not usually cause bleeding.

Epoprostenol (prostacyclin) p. 115 is a prostaglandin and a potent vasodilator. It is used in the treatment of persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension, and in the acute phase following cardiac surgery. It is given by continuous 24-hour intravenous infusion.

Epoprostenol is a powerful inhibitor of platelet aggregation and there is a possible risk of haemorrhage. It is sometimes used as an antiplatelet in renal dialysis when heparins are unsuitable or contra-indicated. It can also cause serious systemic hypotension and, if withdrawn suddenly, can cause pulmonary hypertensive crisis.

Children on prolonged treatment can become tolerant to epoprostenol, and therefore require an increase in dose.

Iloprost p. 116 is a synthetic analogue of epoprostenol and is efficacious when nebulised in adults with pulmonary arterial hypertension, but experience in children is limited. It is more stable than epoprostenol and has a longer half-life.

Bosentan p. 116 is a dual endothelin receptor antagonist used orally in the treatment of pulmonary arterial hypertension. The concentration of endothelin, a potent vasoconstrictor, is raised in sustained pulmonary hypertension.

Sildenafil, a vasodilator developed for the treatment of erectile dysfunction, is also used for pulmonary arterial hypertension. It is used either alone or as an adjunct to other drugs.

Sildenafil is a selective phosphodiesterase type-5 inhibitor. Inhibition of this enzyme in the lungs enhances the
vasodilatory effects of nitric oxide and promotes relaxation of vascular smooth muscle. Sildenafil has also been used in pulmonary hypertension for weaning children off inhaled nitric oxide following cardiac surgery, and less successfully in idiopathic pulmonary arterial hypertension. Tolazoline p. 117 is now rarely used to correct pulmonary artery vasospasm in pulmonary hypertension of the newborn as better alternatives are available. Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

**Antihypertensive drugs**

**Vasodilator antihypertensive drugs**

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive emergencies) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 113 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 114 is given by intravenous infusion to control severe hypertensive crisis when parenteral treatment is necessary. At low doses it reduces systemic vascular resistance and increases cardiac output; at high doses it can produce profound systemic hypotension—continuous blood pressure monitoring is therefore essential. Sodium nitroprusside may also be used to control paradoxical hypertension after surgery for coarctation of the aorta.

Minoxidil p. 114 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and children develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 136, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females. Prazosin p. 98 and doxazosin p. 470 have alpha-blocking and vasodilator properties.

**Centrally acting antihypertensive drugs**

Methyldopa, a centrally acting antihypertensive, is of little value in the management of refractory sustained hypertension in infants and children. On prolonged use it is associated with fluid retention (which may be alleviated by concomitant use of diuretics).

Methyldopa is also effective for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 99 is also a centrally acting antihypertensive but has the disadvantage that sudden withdrawal may cause a hypertensive crisis. Clonidine hydrochloride is also used under specialist supervision for pain management, sedation, and opioid withdrawal, attention deficit hyperactivity disorder, and Tourette syndrome.

**Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use in adults and are rarely used in children.

**Alpha-adrenoceptor blocking drugs**

Doxazosin and prazosin have post-synaptic alpha-blocking and vasodilator properties and rarely cause tachycardia. They can, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

**Drugs affecting the renin-angiotensin system**

**Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. The main indications of ACE inhibitors in children are shown below. In infants and young children, captopril p. 109 is often considered first.

**Initiation under specialist supervision**

Treatment with ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in children.

**Heart failure**

ACE inhibitors have a valuable role in all grades of heart failure, usually combined with a loop diuretic. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. Profound first-dose hypotension can occur when ACE inhibitors are introduced to children with heart failure who are already taking a high dose of a loop diuretic. Temporary withdrawal of the loop diuretic reduces the risk, but can cause severe rebound pulmonary oedema.

**Hypertension**

ACE inhibitors may be considered for hypertension when thiazides and beta-blockers are contra-indicated, not tolerated, or fail to control blood pressure; they may be considered for hypertension in children with type 1 diabetes with nephropathy. ACE inhibitors can reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors also have a role in the management of diabetic nephropathy.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below are present). Hyperkalaemia and other side-effects of ACE inhibitors are more common in children with impaired renal function and the dose may need to be reduced.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In children with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore contra-indicated in children known to have these forms of critical renovascular disease. ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in children with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in those with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If they are
used in these circumstances renal function needs to be monitored.

ACE inhibitors should also be used with particular caution in children who may have undiagnosed and clinically silent renovascular disease. ACE inhibitors are useful for the management of hypertension and proteinuria in children with nephritis. They are thought to have a beneficial effect by reducing intra-glomerular hypertension and protecting the glomerular capillaries and membrane.

**ACE inhibitors in combination with other drugs**

**Concomitant diuretics**

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted children; treatment should therefore be initiated with very low doses. In some children the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

**Angiotensin-II receptor antagonists**

Candesartan cilexetil p. 112, losartan potassium p. 112 and valsartan p. 113 are specific angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for children who have to discontinue an ACE inhibitor because of persistent cough.

Candesartan cilexetil, losartan potassium or valsartan can be used as an alternative to an ACE inhibitor in the management of hypertension.

**Renal effects**

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

**Neonates**

The neonatal response to treatment with ACE inhibitors is very variable, and some neonates develop profound hypotension with even small doses; a test-dose should be used initially and increased cautiously. Adverse effects such as apnoea, seizures, renal failure, and severe unpredictable hypotension are very common in the first month of life and it is therefore recommended that ACE inhibitors are avoided whenever possible, particularly in preterm neonates.

**ALPHA-ADRENOCEPTOR BLOCKERS**

**Prazosin**

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Child 1 month–11 years: Initially 10–15 micrograms/kg 2–4 times a day, initial dose to be taken at bedtime, then increased to 500 micrograms/kg daily in divided doses, dose to be increased gradually; maximum 20 mg per day
      - Child 12–17 years: Initially 500 micrograms 2–3 times a day for 3–7 days, initial dose to be taken at bedtime, then increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses, dose should be increased gradually

**INDICATIONS AND DOSE**

- Child 1 month–11 years: 5 micrograms/kg twice daily, initial dose to be taken at bedtime, then increased to 100 micrograms/kg daily in divided doses, doses should be increased gradually
- Child 12–17 years: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** History of micturition syncope - history of postural hypotension - not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) - first dose hypotension
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
  - **Common or very common** Blurred vision, depression, dizziness, drowsiness, dry mouth, dyspepsia, gastrointestinal disturbances, headache, nasal congestion, nervousness, oedema, palpitations, syncope, urinary frequency, vertigo, weakness
  - **Uncommon** Allergic reactions, arthralgia, epistaxis, eye disorders, impotence, insomnia, paraesthesia, pruritus, rash, sweating, tachycardia, tinnitus, urticaria
  - **Rare** Alopecia, bradycardia, flushing, glycaemastia, hallucinations, pancreatitis, priapism, urinary incontinence, vasculitis, worsening of narcolepsy
  - **Frequency not known** Angioedema, asthenia, hypotension - postural hypotension
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.
- **HEPATIC IMPAIRMENT** Start with low doses and adjust accordingly to response.
- **RENAL IMPAIRMENT** Start with low doses in moderate to severe impairment; increase with caution.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be dispersed in water.
- **PATIENT AND CARER ADVICE** First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed).

**Driving and skilled tasks**

May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Tablet**

- **Prazosin (Non-proprietary)**
  - Prazosin (as Prazosin hydrochloride) 2 mg Minipress 2mg tablets
  - 100 tablet [P] no price available
  - Prazosin (as Prazosin hydrochloride) 5 mg Minipress 5mg tablets
  - 100 tablet [P] no price available

ANTIHYPERTENSIVES, CENTRALLY ACTING

Clonidine hydrochloride

- **INDICATIONS AND DOSE**
  - **Severe hypertension**
    - BY MOUTH
    - Child 2–17 years: Initially 0.5–1 microgram/kg 3 times a day, then increased if necessary up to 25 micrograms/kg daily in divided doses, increase dose gradually; maximum 1.2 mg per day
    - BY SLOW INTRAVENOUS INJECTION
    - Child 2–17 years: 2–6 micrograms/kg (max. per dose 300 micrograms) for 1 dose

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Severe bradycardia secondary to second- or third-degree AV block or sick sinus syndrome
- **CAUTIONS** Cerebrovascular disease · constipation · heart failure · history of depression · mild to moderate bradycardia · polyneuropathy · Raynaud’s syndrome or other occlusive peripheral vascular disease
- **INTERACTIONS** → Appendix 1: clonidine
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · depression · dizziness · dryness · dry mouth · headache · malaise · nausea · postural hypotension · salivary gland pain · sexual dysfunction · sleep disturbances · vomiting
  - **Uncommon** Bradycardia · delusion · hallucination · paraesthesia · pruritus · rash · Raynaud’s syndrome · urticaria
  - **Rare** Alopecia · AV block · colonic pseudo-obstruction · decreased lacrimation · gynaecomastia · nasal dryness
  - **Frequency not known** Bradycardia · confusion · fluid retention · hepatitis · impaired visual accommodation
- **PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING** Avoid—present in milk.
- **RENA IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Must be withdrawn gradually to avoid hypertensive crisis.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use. For Intravenous injection, give over 10–15 minutes; compatible with Sodium Chloride 0.9% or Glucose 5%.
  - With oral use. For administration by mouth, tablets may be crushed and dissolved in water.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Clonidine is less suitable for prescribing.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**BETA-ADRENOCEPTOR BLOCKERS**

Beta-adrenoceptor blocking drugs

**Overview**
Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are available but experience in children is limited to the use of only a few.

Differences between beta-blockers may affect choice. The water-soluble beta-blockers, atenolol p. 103 and sotalol hydrochloride p. 78, are less likely to enter the brain and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Some beta-blockers, such as atenolol, have an intrinsically longer duration of action and need to be given only once daily. Carvedilol p. 122 and labetalol hydrochloride p. 101 are beta-blockers which have, in addition, an arteriolar vasodilating action and thus lower peripheral resistance. Although carvedilol and labetalol hydrochloride possess both alpha- and beta-blocking properties, these drugs have no important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in children with second- or third-degree heart block.

Beta-blockers can precipitate asthma and should usually be avoided in children with a history of asthma or bronchospasm. If there is no alternative, a child with well-controlled asthma can be treated for a co-existing condition (e.g. arrhythmia) with a cardioselective beta-blocker, which should be initiated with caution at a low dose by a specialist and the child monitored closely for adverse effects. Atenolol and metoprolol tartrate p. 103 have less effect on the beta1 (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardioselective; they have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities, and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers). Beta-blockers can affect carbohydrate metabolism causing hypoglycaemia or hyperglycaemia in children with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (e.g. atenolol and metoprolol tartrate) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia.

**Hypertension**
Beta-blockers are effective for reducing blood pressure, but their mode of action is not understood; they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action. Blood pressure...
can usually be controlled with relatively few side-effects. In general the dose of beta-blocker does not have to be high.

Labetalol hydrochloride may be given intravenously for hypertensive emergencies in children; however, care is needed to avoid dangerous hypotension or beta-blockade, particularly in neonates. Esmolol hydrochloride p. 103 is also used intravenously for the treatment of hypertension particularly in the peri-operative period.

Beta-blockers can be used to control the pulse rate in children with pheochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis; phenoxybenzamine hydrochloride p. 114 should always be used together with the beta-blocker.

Arrhythmias
In arrhythmias, beta-blockers act principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used alone or in conjunction with digoxin p. 79 to control the ventricular rate in atrial fibrillation. Beta-blockers are also useful in the management of supraventricular tachycardias and ventricular tachycardias particularly to prevent recurrence of the tachycardia.

Esmolol hydrochloride is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias and sinus tachycardia, particularly in the peri-operative period.

Sotalol hydrochloride is a non-cardioselective beta-blocker with additional class III anti-arhythmic activity. Atenolol and sotalol hydrochloride suppress ventricular ectopic beats and non-sustained ventricular tachycardia. However, the pro-arhythmic effects of sotalol hydrochloride, particularly in children with sick sinus syndrome, may prolong the QT interval and induce torsade de pointes.

Heart failure
Beta-blockers may produce benefit in heart failure by blocking sympathetic activity and the addition of a beta-blocker such as carvedilol to other treatment for heart failure may be beneficial. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis
Beta-blockers are used in the management of thyrotoxicosis including neonatal thyrotoxicosis; propranolol hydrochloride p. 101 can reverse clinical symptoms within 4 days. Beta-blockers are also used for the pre-operative preparation for thyroidectomy; the thyroid gland is rendered less vascular, thus facilitating surgery.

Other uses
In tetralogy of Fallot, esmolol hydrochloride or propranolol hydrochloride may be given intravenously in the initial management of cyanotic spells; propranolol hydrochloride is given by mouth for preventing cyanotic spells. If a severe cyanotic spell in a child with congenital heart disease persists despite optimal use of 100% oxygen, propranolol hydrochloride is given by intravenous infusion. If cyanosis is still present after 10 minutes, sodium bicarbonate p. 558 intravenous infusion is given in a dose to correct acidosis (or dose calculated according to arterial blood gas results); sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year. If blood-glucose concentration is less than 3 mmol/litre, glucose 10% intravenous infusion is given, followed by intravenous or intramuscular injection of morphine p. 271.

Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 653, carteolol hydrochloride p. 654, levobunolol hydrochloride p. 654, and timolol maleate p. 654 are used topically in glaucoma.

**Beta-adrenoceptor blockers (systemic)**

- **CONTRA-INDICATIONS** Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - pheochromocytoma (apart from use with alpha-blockers) - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

- **CAUTIONS** Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously) - myasthenia gravis - portal hypertension (risk of deterioration in liver function) - psoriasis - symptoms of thyrotoxicosis may be masked

- **SIDE-EFFECTS**
  - Rare: Dry eyes (reversible on withdrawal) - rashes (reversible on withdrawal)

- **SIDE-EFFECTS, FURTHER INFORMATION**

- **Bradydysrhythmia** With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

- **Overdose** Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 803.

- **ALLERGY AND CROSS-SENSITIVITY** Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).

- **PREGNANCY** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.

- **BREAST FEEDING** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.

- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).

- **TREATMENT CESSATION** Avoid abrupt withdrawal.
**BETA-ADRENOCEPTOR BLOCKERS**

**Labetalol hydrochloride**

### INDICATIONS AND DOSE

**Hypertensive emergencies**

- **BY INTRAVENOUS INFUSION**
  - Neonate: Initially 0.5 mg/kg/hour (max. per dose 4 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes.
  - Child 1 month-11 years: Initially 0.5–1 mg/kg/hour (max. per dose 3 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes
  - Child 12-17 years: Initially 30–120 mg/hour, dose to be adjusted according to response at intervals of at least 15 minutes

**Hypertension**

- **BY MOUTH**
  - Child 1 month-11 years: 1–2 mg/kg 3–4 times a day
  - Child 12-17 years: Initially 50–100 mg twice daily, dose to be increased if required at intervals of 3–14 days; usual dose 200–400 mg twice daily, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- **BY INTRAVENOUS INJECTION**
  - Child 1 month-11 years: 250–500 micrograms/kg (max. per dose 20 mg) for 1 dose
  - Child 12-17 years: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

**UNLICENSED USE**

Not licensed for use in children.

### IMPORTANT SAFETY INFORMATION

- **With intravenous use**
  - Consult local guidelines. In hypertensive encephalopathy reduce blood pressure to normotensive level over 24–48 hours (more rapid reduction may lead to cerebral infarction, blindness, and death). If child fitting, reduce blood pressure rapidly, but not to normal levels.

- **CAUTIONS**
  - Liver damage

- **INTERACTIONS**
  - Appendix 1: beta blockers (non-selective)

- **SIDE-EFFECTS**
  - Rare: Lichenoid rash
  - Frequency not known: Difficulty in micturition, epigastric pain, liver damage, nausea, postural hypotension, vomiting, weakness

- **PREGNANCY**
  - The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

- **BREAST FEEDING**
  - Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

- **HEPATIC IMPAIRMENT**
  - Avoid—severe hepatocellular injury reported.

- **RENAL IMPAIRMENT**
  - Dose reduction may be required.

- **MONITORING REQUIREMENTS**
  - Liver damage: Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.

### EFFECT ON LABORATORY TESTS

Interferes with laboratory tests for catecholamines.

### DIRECTIONS FOR ADMINISTRATION

- **With intravenous use**
  - For intravenous infusion, dilute to a concentration of 1 mg/mL in Glucose 5% or Sodium Chloride and Glucose 5%; if fluid restricted may be given undiluted, preferably through a central venous catheter. Avoid upright position during and for 3 hours after intravenous administration.
  - With oral use: For administration by mouth, injection may be given orally with squash or juice.

### PATIENT AND CARER ADVICE

**Non-Selective**

### Propranolol hydrochloride

#### INDICATIONS AND DOSE

**Hypothyroidism with autonomic symptoms**

- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
  - Child: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours)

- **BY INTRAVENOUS INJECTION**
  - Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.
  - Child: Initially 25–50 micrograms/kg every 6–8 hours (max. per dose 5 mg), adjusted according to response, to be given over 10 minutes

**Thyrotoxicosis (adjunct)**

- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
  - Child: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response continued →
**Blood pressure conditions**

**Hypertension**
- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
  - Child 1 month–11 years: Initially 0.25–1 mg/kg 3–4 times a day (max. per dose 2 mg/kg 4 times a day), adjusted according to response; maximum 160 mg per day.
  - Child 12–17 years: Initially 200–500 micrograms/kg twice daily; usual dose 10–20 mg twice daily (max. per dose 2 mg/kg twice daily).
  - Child 12–17 years: Initially 20–40 mg twice daily; usual dose 40–80 mg twice daily (max. per dose 120 mg); maximum 4 mg/kg per day.

**Malignant hyperpyrexia**
- **BY INTRAVENTRICAL INJECTION**
  - Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.
  - Child: Initially 25–50 micrograms/kg every 6–8 hours (max. per dose 5 mg), adjusted according to response, to be given over 10 minutes.

**Thyrotoxic crisis**
- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
  - Child: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours).

**Arrhythmias**
- **BY MOUTH**
  - Neonate: 250–500 micrograms/kg 3 times a day, adjusted according to response.
  - Child: 250–500 micrograms/kg 3–4 times a day (max. per dose 1 mg/kg 4 times a day), adjusted according to response; maximum 160 mg per day.
  - Child: 20–50 micrograms/kg, then 20–50 micrograms/kg every 6–8 hours if required, eCG monitoring required.
  - Child: 25–50 micrograms/kg, then 25–50 micrograms/kg every 6–8 hours if required, eCG monitoring required.

**Hepatitis**
- **BY INTRAVENTRICAL INJECTION**
  - Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.

**Child 1 month–11 years**
- Initially 15–20 micrograms/kg (max. per dose 100 micrograms/kg), then 15–20 micrograms/kg every 12 hours if required, eCG monitoring is required with administration.

**Cardiovascular system**

**Migraine prophylaxis**
- **BY MOUTH**
  - Child 2–11 years: Initially 200–500 micrograms/kg twice daily; usual dose 10–20 mg twice daily (max. per dose 2 mg/kg twice daily).
  - Child 12–17 years: Initially 20–40 mg twice daily; usual dose 40–80 mg twice daily (max. per dose 120 mg); maximum 4 mg/kg per day.

**Unlicensed use**
- Not licensed for treatment of hypertension in children under 12 years.

**Interactions**
- Appendix 1: beta blockers (non-selective)

**Side-effects**
- Rare: Dry eyes (reversible on withdrawal)
- Hepatic impairment: Reduce oral dose.
- Renal impairment: Manufacturer advises caution; dose reduction may be required.

**Directions for administration**
- For slow intravenous injection, give over at least 3–5 minutes; rate of administration should not exceed 1 mg/minute. May be diluted with Sodium Chloride 0.9% or Glucose 5%. Incompatible with bicarbonate.

**Prescribing and dispensing information**
- Modified-release preparations can be used for once daily administration.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS 8**
  - Propranolol hydrochloride (Non-proprietary)
    - Propranolol hydrochloride 1 mg per 1 ml
      - Propranolol 80 mg/5 ml oral solution sugar free: £24.98 DT price = £31.50
      - Propranolol hydrochloride 2 mg per 1 ml
        - Propranolol 160 mg/5 ml oral solution sugar free: £31.50 DT price = £20.45
      - Propranolol hydrochloride 8 mg per 1 ml
        - Propranolol 320 mg/5 ml oral solution sugar free: £29.98 DT price = £40.45
    - Propranolol hydrochloride 10 mg per 1 ml
      - Propranolol 50 mg/5 ml oral solution sugar free: £29.98 DT price = £41.59

**Modified-release capsule**
- **CAUTIONARY AND ADVISORY LABELS 8, 25**
  - Propranolol hydrochloride (Non-proprietary)
    - Propranolol hydrochloride 80 mg
      - Propranolol 80 mg modified-release capsules: 28 capsule £9.45 DT price = £12.83
      - Propranolol hydrochloride 160 mg
        - Propranolol 160 mg modified-release capsules: 28 capsule £14.88 DT price = £20.45
      - Bedranol SR (Sandoz Ltd, Aplimus Pharmaceuticals Ltd)
        - Bedranol hydrochloride 80 mg
          - Bedranol SR 80 mg capsules: 28 capsule £5.16 DT price = £7.50
          - Bedranol hydrochloride 160 mg
            - Bedranol SR 160 mg capsules: 28 capsule £4.59–£5.09 DT price = £6.59
    - Beta-Propran (Tillomed Laboratories Ltd, Actavis UK Ltd, Teva UK Ltd)
      - Propranolol hydrochloride 160 mg
        - Beta-Propran 160mg modified-release capsules: 28 capsule £6.11 DT price = £8.41
      - Half Beta-Propran (Teva UK Ltd, Tillomed Laboratories Ltd, Actavis UK Ltd)
        - Propranolol hydrochloride 80 mg
          - Half Beta-Propran 80mg modified-release capsules: 28 capsule £4.95 DT price = £6.95

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS 8**
  - Propranolol hydrochloride (Non-proprietary)
    - Propranolol hydrochloride 10 mg
      - Propranolol 10 mg tablets: 28 tablet £1.47 DT price = £2.03

**BY SLOW INTRAVENTRICAL INJECTION**
- Neonate: Initially 15–20 micrograms/kg (max. per dose 100 micrograms/kg), then 15–20 micrograms/kg every 12 hours if required, eCG monitoring is required with administration.

- Child 1 month–11 years: Initially 15–20 micrograms/kg (max. per dose 100 micrograms/kg), higher doses are rarely necessary, then 15–20 micrograms/kg every 6–8 hours if required, eCG monitoring is required with administration.
Propranolol hydrochloride 40 mg Propranolol 40mg tablets | 28 tablet [Pot] £1.85 DT price = £0.85
Propranolol hydrochloride 80 mg Propranolol 80mg tablets | 56 tablet [Pot] £9.33 DT price = £1.53
Propranolol hydrochloride 160 mg Propranolol 160mg tablets | 56 tablet [Pot] £5.87 DT price = £0.87

BETA-ADRENOCEPTOR BLOCKERS ▶ SELECTIVE

**Atenolol**

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - **Neonate:** 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.
      - **Child 1 month-11 years:** 0.5–2 mg/kg once daily, dose may be given in 2 divided doses, doses higher than 50 mg daily are rarely necessary
      - **Child 12-17 years:** 25–50 mg once daily, dose may be given in 2 divided doses, higher doses are rarely necessary
  - **Arrhythmias**
    - **BY MOUTH**
      - **Neonate:** 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.
      - **Child 1 month-11 years:** 0.5–2 mg/kg once daily, dose may be given in 2 divided doses; maximum 100 mg per day
      - **Child 12-17 years:** 50–100 mg once daily, dose may be given in 2 divided doses

- **UNLICENCED USE** Not licensed for use in children under 12 years.
- **INTERACTIONS** ▶ Appendix 1: beta blockers (selective)
- **BREAST FEEDING** Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.
- **RENAL IMPAIRMENT** Initially use 50% of usual dose if estimated glomerular filtration rate 10–35 mL/minute/1.73 m²; initially use 30–50% of usual dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**

- **Non-proprietary** Atenolol 5 mg per 1 ml Atenolol 25mg/5ml oral solution sugar free sugar-free | 300 ml [Pot] £6.72 DT price = £5.59
- **Tablet**
  - **Atenolol (Non-proprietary)**
    - Atenolol 25 mg Atenolol 25mg tablets | 28 tablet [Pot] £1.39 DT price = £0.71

      - **Child 12-17 years:** Initially 50–100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely necessary; maximum 400 mg per day
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - **Child 12-17 years:** 200 mg once daily continued →
### Calcium-channel blockers

#### Overview
Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 106, diltiazem hydrochloride p. 140, and the dihydropyridine calcium-channel blockers (amlodipine below, nicardipine p. 106, and nimodipine p. 84). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of hypertension and arrhythmias. However, it is no longer first-line treatment for arrhythmias in children because it has been associated with fatal collapse especially in infants under 1 year; adenosine p. 77 is now recommended for first-line use.

Verapamil hydrochloride is a highly negatively inotropic calcium-channel blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine may be used if a modified-release preparation delivering the appropriate dose is not available or if a child is unable to swallow (a liquid preparation may be prepared using capsules). Nifedipine may also be used for the management of angina due to coronary artery disease in Kawasaki disease or progeria and in the management of Raynaud’s syndrome.

Nifedipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility; it should only be used for the treatment of life-threatening hypertension in paediatric intensive care settings and in postoperative hypertension.

Amlodipine also resembles nifedipine and nimodipine hydrochloride in its effects and does not reduce myocardial contractility or produce clinical deterioration in heart failure. It has a longer duration of action and can be given once daily. Nifedipine and amlodipine are used for the treatment of hypertension. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is a peripheral vasodilator and also has mild depressor effects on the myocardium. It is used in the treatment of Raynaud’s syndrome.

### Calcium-channel blockers

#### Amlodipine

- **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

#### DRUG ACTION

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Child 1 month–11 years: Initially 100–200 micrograms/kg once daily; increased if necessary up to 400 micrograms/kg once daily, adjusted at intervals of 1–2 weeks; maximum 10 mg per day
      - Child 12–17 years: Initially 5 mg once daily, then increased if necessary up to 10 mg once daily, adjusted at intervals of 1–2 weeks

#### DOSE EQUIVALENCE AND CONVERSION

- Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.
**Nicardipine hydrochloride**

**DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**CONTRA-INDICATIONS** Acute porphyrias p. 577 avoid within 8 days of myocardial infarction; cardiogenic shock; compensatory hypertension; significant or advanced aortic stenosis.

**CAUTIONS** Congestive heart failure; elevated intracranial pressure; increased risk of serious hypotension; portal hypertension; pulmonary oedema; significantly impaired left ventricular function; stroke.

**INTERACTIONS** Appendix 1: calcium channel blockers

**SIDE-EFFECTS** ATivoventricular block; dizziness; flushing; headache; hypotension; nausea; palpitations; paralytic ileus; peripheral oedema; pulmonary oedema; tachycardia; thrombocytopenia; urticaria; vasculitis

**MILD SIDE-EFFECTS**
- Dry mouth
- Nausea
- Diaphoresis
- Headache
- Fatigue
- Leg cramps
- Muscle cramps
- Rash
- Itching
- Pruritus
- Palpitations
- Tachycardia
- Angioedema
- Pruritus
- Purpura
- Itching
- Rashes
- Diaphoresis
- Nausea

**INTERACTIONS**
- Painkillers
- Beta-blockers
- Calcium channel blockers
- ACE-inhibitors

**DIRECTIONS FOR ADMINISTRATION**
- Tablets may be dispersed in water.
- Intravenous: Continuous infusion
- Oral solution

**MEDICINAL FORMS**
- Amlodipine (Non-proprietary)
- Amlodipine 1 mg per 1 ml
- Amlodipine 5 mg/5 ml oral solution sugar free: £75.76 DT price = £75.76
- Amlodipine 2 mg per 1 ml
- Amlodipine 10 mg/5 ml oral solution sugar free: £115.73 DT price = £115.73

**CONTRA-INDICATIONS**
- Abdominal pain; dizziness; fatigue; flushing; headache; nausea; oedema; palpitation; sleep disturbances
- Alopecia; arthralgia; asthenia; back pain; chest pain; dry mouth; dyspnoea; gastro-intestinal disturbances; gynaecomastia; hypotension; impotence; mood changes; muscle cramps; myalgia; paraesthesia; pruritus; purpura; rashes; rhinitis; skin discoloration; sweating; syncope; taste disturbances; tinnitus; tremor; urinaiy disturbances; visual disturbances; weight changes
- Frequency not known: Erythema multiforme

**Overdose**
- In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**
- No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- May need dose reduction—half-life prolonged.

**DIRECTIONS FOR ADMINISTRATION**
- Tablets may be dispersed in water.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Amlodipine for hypertension www.medicinesforchildren.org.uk/amlodipine-for-hypertension

**HEPATIC IMPAIRMENT**
- Acceptable alternative. Toxicity in pregnancy (twins or more) unless there is no other acceptable alternative. Toxiciy in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia—avoid excessive decrease in blood pressure.

**BREAST FEEDING**
- Manufacturer advises avoid—present in breast milk.

**HEPATIC IMPAIRMENT**
- Half-life prolonged in severe impairment—consider using low initial dose. Use with caution in hepatic impairment—increased risk of serious hypotension.

**RENAI IMPAIRMENT**
- Use with caution—increased risk of serious hypotension; consider using low initial dose.

**MONITORING REQUIREMENTS**
- Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

**DIRECTIONS FOR ADMINISTRATION**
- Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.

  For continuous intravenous infusion, dilute to a concentration of 100–200 micrograms/ml with Glucose 5% and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.
**Nifedipine**

**INDICATIONS AND DOSE**

**Hypertensive crisis / Acute angina in Kawasaki disease or progeria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child: Initially 250–500 micrograms/kg (max. per dose 10 mg), then repeat once if necessary, may cause unpredictable and severe reduction of blood pressure—monitor closely following administration; if ineffective consider alternative treatment and seek specialist advice

**Hypertension / Angina in Kawasaki disease or progeria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1 month–11 years: 200–300 micrograms/kg 3 times a day, dose frequency depends on preparation used; maximum 3 mg/kg per day; maximum 90 mg per day
  - Child 12–17 years: 5–20 mg 3 times a day, dose frequency depends on preparation used; maximum 90 mg per day

**Raynaud’s syndrome**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2–17 years: 2.5–10 mg 2–4 times a day, start with low doses at night and increase gradually to avoid postural hypotension, dose frequency depends on preparation used

**Persistent hyperinsulinaemic hypoglycaemia**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Neonate: 100–200 micrograms/kg 4 times a day (max. per dose 600 micrograms/kg).

**SIDE-EFFECTS**
- **Common or very common**
  - Asthenia
  - Dizziness
  - Gastrointestinal disturbance
  - Headache
  - Hypotension
  - Lethargy
  - Oedema
  - Palpitation
  - Vasodilatation
- **Uncommon**
  - Angioedema
  - Anxiety
  - Chills
  - Dyspnoea
  - Dysuria
  - Epistaxis
  - Erectile dysfunction
  - Hypersensitivity reactions
  - Jaundice
  - Joint swelling
  - Migraine
  - Myalgia
  - Nasal congestion
  - Nocturia
  - Paraesthesia
  - Polyuria
  - Pruritus
  - Rash
  - Sleep disturbance
  - Sweating
  - Syncope
  - Tachycardia
  - Tremor
  - Urticaria
  - Vertigo
  - Visual disturbance
- **Rare**
  - Anorexia
  - Gum hyperplasia
  - Hyperglycaemia
  - Male infertility
  - Mood disturbances
  - Photosensitivity reactions
  - Purpura

**UNLICENSED USE**

- Not licensed for use in children.

**CONTRA-INDICATIONS**

- Cardiogenic shock
- Significant aortic stenosis

**CAUTIONS**

- Diabetes mellitus
- Heart failure
- Poor cardiac reserve
- Severe hypertension
- Short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia—significantly impaired left ventricular function (heart failure deterioration observed)

**INTERACTIONS**

- Appendix 1: calcium channel blockers

**CONTRA-INDICATIONS**

- Acute porphyrias

---

**Verapamil hydrochloride**

**INDICATIONS AND DOSE**

**Treatment of supraventricular arrhythmias**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1–17 years (administered on expert advice): 100–300 micrograms/kg (max. per dose 5 mg) for 1 dose, to be given over 2–3 minutes (with ECG and blood-pressure monitoring), dose can be repeated after 30 minutes if necessary

**Hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2–17 years (administered on expert advice): 20 mg 2–3 times a day
  - Child 2–17 years (administered on expert advice): 40–120 mg 2–3 times a day

**Prephylaxis of supraventricular arrhythmias (administered on expert advice)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12–23 months: 20 mg 2–3 times a day
  - Child 2–17 years: 40–120 mg 2–3 times a day

**CONTRA-INDICATIONS**

- Acute porphyrias
- Atrial flutter
- Fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome)
bradycardia, cardiogenic shock, history of heart failure (even if controlled by therapy), history of significantly impaired left ventricular function (even if controlled by therapy), hypotension, second- and third-degree AV block, sick sinus syndrome, sino-atrial block.

**Cautions**
First-degree AV block

**Interactions**
Appendix 1: calcium channel blockers

**Side-effects**

- **Common or very common**
  - Constipation
- **Uncommon**
  - Ankle oedema, dizziness, fatigue, flushing, headache, nausea, vomiting
- **Rare**
  - Allergic reactions, angioedema, arthralgia, asystole, bradycardia, erythema, erythromelalgia, gingival hyperplasia after long-term treatment, gynaecomastia after long-term treatment, heart block, heart failure, hypersensitivity reactions involving reversibly raised liver function tests, hypotension, increased prolactin concentration, myalgia, paraesthesia, pruritus, Stevens-Johnson syndrome, urticaria

**Side-effects, further information**

- Intravenous administration or high doses Hypotension, heart failure, bradycardia, heart block, and asystole are side-effects associated with intravenous administration or high doses.

**Overdose**
In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

**Pregnancy**
May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.

**Breast Feeding**
Amount too small to be harmful.

**Hepatic Impairment**
Oral dose may need to be reduced.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%. Incompatible with solutions of pH greater than 6.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- Verapamil hydrochloride 2.5 mg per 1 ml Securon IV 5mg/2ml solution for injection ampoules | 1 ampoule [POT] £0.41

**Oral solution**
- Verapamil hydrochloride (Non-proprietary)
- Verapamil hydrochloride 8 mg per 1 ml Verapamil 40mg/5ml oral solution sugar-free sugar-free | 150 ml [POT] £3.00 DT price = £30.00

**DIURETICS**

**Thiazides and related diuretics**

- **Contra-indications**
  - Addison’s disease, hypercalcaemia, hyponatraemia, refractory hypokalaemia, symptomatic hyperuricaemia
- **Cautions**
  - Diabetes, gout, hyperaldosteronism, malnourishment, nephrotic syndrome, systemic lupus erythematosus

**Cautions, further information**

- Potassium loss: Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.
- Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy.
- The use of potassium-sparing diuretics avoids the need to take potassium supplements.
- Existing conditions: Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

**Side-effects**

- **Common or very common**
  - Altered plasma-lipid concentrations, gout, hypercalcaemia, hyperglycaemia, hyperuricaemia, hypochloraeic alkalosis, hypokalaemia, hypomagnesaemia, hyponatraemia, metabolic and electrolyte disturbances, mild gastrointestinal disturbances, postural hypotension
- **Uncommon**
  - Agranulocytosis, blood disorders, impotence, leucopenia, thrombocytopenia
- **Frequency not known**
  - Cardiac arrhythmias, dizziness, headache, hypersensitivity reactions, intrabehaptic cholestasis, pancreatitis, paraesthesia, photosensitivity, pneumonitis, pulmonary oedema, severe skin reactions, visual disturbances

**Pregnancy**
Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

**Hepatic Impairment**
Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic.

**Renal Impairment**
Thiazides and related diuretics should be used with caution because they can further reduce renal function. They are ineffective if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

**Monitoring Requirements**
Electrolytes should be monitored, particularly with high doses and long-term use.

**Bendrofluamethiazide**

**Indications and Dose**

**Hypertension**

- **By mouth**
  - **Child 1 month-1 year**: 50–100 micrograms/kg daily, adjusted according to response
  - **Child 2-11 years**: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day
  - **Child 12-17 years**: 2.5 mg once daily, dose to be taken as a single dose in the morning, higher doses are rarely necessary
Oedema in heart failure, renal disease and hepatic disease | Pulmonary oedema
- BY MOUTH
  - Child 1 month-1 year: 50–100 micrograms/kg daily, adjusted according to response
  - Child 2-11 years: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day
  - Child 12-17 years: Initially 5–10 mg once daily or on alternate days, adjusted according to response, dose to be taken as a single dose in the morning; maximum 10 mg per day

- INTERACTIONS → Appendix 1: thiazide diuretics
- BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM → ACE INHIBITORS

Angiotensin-converting enzyme inhibitors
- CONTRA-INDICATIONS Bilateral renovascular disease
- CAUTIONS Afro-Caribbean patients (may respond less well to ACE inhibitors) • comonitant diuretics • diabetes (may lower blood glucose) • first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) • neonates (in neonates) • primary aldosteronism (patients may respond less well to ACE inhibitors) • the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) • use with care (or avoided) in those with a history of idiopathic or hereditary angioedema • use with care in patients with hypertrophic cardiomyopathy • use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)
- FURTHER INFORMATION
  - Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.
- SIDE-EFFECTS
  - Common or very common Apnoea (in neonates) • renal failure (in neonates) • seizures (in neonates) • severe unpredictable hypotension (in neonates)
  - Frequency not known Pruritus • abdominal pain • altered liver function tests • angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) • arthralgia • blood disorders • bronchospasm • cholestatic jaundice • constipation • diarrhoea • dizziness • dyspepsia • eosinophilia • fatigue • fever • fulminant hepatic necrosis • haemolytic anaemia • headache • hepatic failure • hepatitis • hyperkalaemia • hypoglycaemia • leucocytosis • leucopenia • malaise • myalgia • nausea • neutropenia • pancreatitis • paraesthesia • persistent dry cough • photosensitivity • positive antinuclear antibody • profound hypotension • raised erythrocyte sedimentation rate • rash • renal impairment • rhinitis • serositis • sinusitis • sore throat • taste disturbance • thrombocytopenia • urticaria • vasculitis • vomiting
- SIDE-EFFECTS, FURTHER INFORMATION
  - Hepatic effects In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.
  - ALLERGY AND CROSS-SENSITIVITY ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
  - PREGNANCY ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.
  - BREAST FEEDING Information on the use of ACE inhibitors in breast-feeding is limited.
  - RENAL IMPAIRMENT Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common

Chlorothiazide

- INDICATIONS AND DOSE
  - Heart failure | Hypertension | Ascites
  - BY MOUTH
    - Neonate: 10–20 mg/kg twice daily.
    - Child 1-5 months: 10–20 mg/kg twice daily
    - Child 6 months-11 years: 10 mg/kg twice daily; maximum 1 g per day
    - Child 12-17 years: 0.25–1 g once daily, alternatively 125–500 mg twice daily
  - Reduction of diazoxide-induced sodium and water retention in the management of chronic hypoglycaemia | Potentiating the glycaemic effect of diazoxide in the management of chronic hypoglycaemia
  - BY MOUTH
    - Child: 3–5 mg/kg twice daily
  - Nephrogenic and partial pituitary diabetes insipidus
  - BY MOUTH
    - Child: 10–20 mg/kg twice daily (max. per dose 500 mg)

- UNLICENSED USE Not licensed.
- CAUTIONS Neonate (theoretical risk of kernicterus if very jaundiced)
- BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

in those with impaired renal function and the dose may need to be reduced.

- **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

### Captopril

#### INDICATIONS AND DOSE

**Hypertension**

- **BY MOUTH**

  - **Preterm neonate (initiated under specialist supervision):** Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Neonate (initiated under specialist supervision):** Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Child 1–11 months (initiated under specialist supervision):** Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Child 1–11 years (initiated under specialist supervision):** Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 6 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Child 12–17 years (initiated under specialist supervision):** Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated.

**Heart failure**

- **BY MOUTH**

  - **Preterm neonate (initiated under specialist supervision):** Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Neonate (initiated under specialist supervision):** Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
  
  - **Child 1–11 months (initiated under specialist supervision):** Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

**Diabetic nephropathy in type 1 diabetes mellitus**

- **BY MOUTH**

  - **Child 1–11 years (under expert supervision):** Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- **UNLICENSED USE** Not licensed for use in children under 18 years.

- **INTERACTIONS** → Appendix 1: ACE inhibitors

- **SIDE-EFFECTS**

  - **Common or very common** Alopecia, dry mouth, dyspepsia, sleep disorder
  
  - **Uncommon** Angina, arrhythmia, flushing, pallor, palpitation, Raynaud’s syndrome, tachycardia
  
  - **Rare** Anorexia, stomatitis
  
  - **Very rare** Allergic alveolitis, blurred vision, cardiac arrest, cardiogenic shock, cerebrovascular events, confusion.
**Cardiovascular system**

**Blood pressure conditions**

- Depression - eosinophilic pneumonia - glossitis - gynaecomastia - hyponatraemia - impotence - peptic ulcer - photosensitivity - Stevens-Johnson syndrome - syncope

**Breastfeeding**

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breastfeeding older infants if essential but monitor infant’s blood pressure.

**Directions for Administration**

Administer under close supervision. Give test dose whilst child supine. Tablets can be dispersed in water.

**Patient and Carer Advice**

Medicines for Children leaflet: Captopril for heart failure

For further information, please see the Medicines for Children leaflet: Captopril for heart failure.

---

**Enalapril maleate**

**Indications and Dose**

**Hypertension**

- **By Mouth**

  - Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

  - Child 1 month–11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

  - Child 12–17 years (under expert supervision) (body-weight up to 50 kg): Initially 500 micrograms/kg, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses, limited information.

  - Child 12–17 years (under expert supervision) (body-weight over 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses, maximum 40 mg per day.

**Side-effects**

- **Unlicensed Use** Not licensed for use in children for congestive heart failure, proteinuria in nephritis or diabetic nephropathy; not licensed for use in children less than 20 kg for hypertension.

- **Interactions** ➔ Appendix 1: ACE inhibitors

- **Common or very common** Asthenia - blurred vision - depression - dyspnoea

- **Uncommon** Alopecia - anorexia - arrhythmias - confusion - drowsiness - dry mouth - flushing - hyponatraemia - ileus - impotence - insomnia - muscle cramps - nervousness - palpitation - peptic ulcer - sweating - tinnitus - vertigo

- **Rare** Abnormal dreams - allergic alveolitis - exfoliative dermatitis - glossitis - gynaecomastia - pemphigus - pulmonary infiltrates - Raynaud’s syndrome - Stevens-Johnson syndrome - stomatitis - toxic epidermal necrolysis

- **Very rare** Gastro-intestinal angioedema

**Breastfeeding**

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension.
hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

- **HEPATIC IMPAIRMENT** Enalapril is a prodrug and requires close monitoring in patients with hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and suspended in water immediately before use.

- **Lisinopril**

  - **INDICATIONS AND DOSE**

    **Hypertension**
    - **BY MOUTH**
      - Child 6–11 years (under expert supervision): Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks
      - Child 12–17 years (under expert supervision): Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day

    **Proteinuria in nephritis (under expert supervision)**
    - **BY MOUTH**
      - Child 6–11 years: Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks
      - Child 12–17 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day

    **Diabetic nephropathy (under expert supervision)**
    - **BY MOUTH**
      - Child 6–11 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day
      - Child 12–17 years: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

- **SIDE-EFFECTS**

  - **Uncommon** Raynaud’s syndrome • vertigo • asthenia • cerebrovascular accident • confusion • impotence • mood changes • palpitation • sleep disturbances • tachycardia
  - **Rare** Alopecia • dry mouth • gynaecomastia • psoriasis
  - **Very rare** Allergic alveolitis • pemphigus • profuse sweating • pulmonary infiltrates • Stevens–Johnson syndrome • toxic epidermal necrolysis

- **BREAST FEEDING**

  Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

- **PATIENT AND CARER ADVICE**

      - £6.51 DT price = £0.83

- **DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM › ANGIOTENSIN II RECEPTOR ANTAGONISTS**

  **Angiotensin II receptor antagonists**

  - **TAKE CARE**
    - **Caution**
      - Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) • aortic or mitral valve stenosis • hypertrophic cardiomyopathy • patients with a history of angioedema • patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) • renal artery stenosis
    - **SIDE-EFFECTS**
      - Hyperkalaemia • angioedema (may be delayed onset) • symptomatic hypotension including dizziness (particularly in children with hyponatraemia or intravascular volume depletion e.g. those taking high-dose diuretics)
    - **PREGNANCY**
      - Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.
    - **BREAST FEEDING**
      - Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

- **UNLICENSED USE**

  Not licensed for use in children.

- **INTERACTIONS**

  → Appendix 1: ACE inhibitors
Candesartan cilexetil

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Child 6–7 years (under expert supervision) (body-weight up to 50 kg): Initially 4 mg once daily, adjusted according to response; lower dose may be used in intravascular volume depletion; maximum 8 mg per day.
  - Child 6–7 years (under expert supervision) (body-weight 50 kg and above): Initially 4 mg once daily, adjusted according to response; lower dose may be used in intravascular volume depletion; maximum 16 mg per day.

**SIDE-EFFECTS**
- **Common or very common**
  - Cough
  - Headache
  - Rash
  - Vertigo
- **Uncommon**
  - Nausea
  - Dizziness
  - Fatigue
  - Pruritus
  - Urticaria

**HEPATIC IMPAIRMENT**
Reduce initial dose in mild or moderate impairment. Avoid in severe hepatic impairment.

**RENAL IMPAIRMENT**
Reduce initial dose. Use with caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

**MEDIcINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**
- **Candesartan cilexetil (Non-proprietary)**
  - **Candesartan cilexetil 2 mg** Candesartan 2mg tablets | 7 tablet [POM] £3.40 DT price = £1.92
  - **Candesartan cilexetil 4 mg** Candesartan 4mg tablets | 7 tablet [POM] £7.82 DT price = £0.66 | 28 tablet [POM] £9.78
  - **Candesartan cilexetil 8 mg** Candesartan 8mg tablets | 28 tablet [POM] £9.89 DT price = £0.98
  - **Candesartan cilexetil 16 mg** Candesartan 16mg tablets | 28 tablet [POM] £12.72 DT price = £1.15
  - **Candesartan cilexetil 32 mg** Candesartan 32mg tablets | 28 tablet [POM] £16.13 DT price = £1.59

  - **Amias (Takeda UK Ltd)**
    - **Candesartan cilexetil 2 mg** Amias 2mg tablets | 7 tablet [POM] £3.58 DT price = £1.92
    - **Candesartan cilexetil 4 mg** Amias 4mg tablets | 7 tablet [POM] £3.88 DT price = £0.66 | 28 tablet [POM] £9.78
    - **Candesartan cilexetil 8 mg** Amias 8mg tablets | 28 tablet [POM] £9.89 DT price = £0.98
    - **Candesartan cilexetil 16 mg** Amias 16mg tablets | 28 tablet [POM] £12.72 DT price = £1.15
    - **Candesartan cilexetil 32 mg** Amias 32mg tablets | 28 tablet [POM] £16.13 DT price = £1.59

Losartan potassium

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Child 6–17 years (under expert supervision) (body-weight 20–49 kg): Initially 700 micrograms/kg once daily (max. per dose 25 mg), adjusted according to response to 50 mg daily, lower initial dose may be used in intravascular volume depletion; maximum 50 mg per day.
  - Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 50 mg once daily, adjusted according to response to 1.4 mg/kg once daily; maximum 100 mg per day.

**Hypertension with intravascular volume depletion**
- **BY MOUTH**
  - Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 25 mg once daily; adjusted according to response to 1.4 mg/kg once daily; maximum 100 mg per day.

**CAUTIONS** Severe heart failure

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**
- **Common or very common**
  - Anaemia
  - Malaise
  - Nausea
  - Vomiting
  - Diarrhoea
  - Rash
  - Urticaria
  - Palpitation

**RARE**
- Atrial fibrillation
- Cerebrovascular accident
- Hepatitis
- Parasthesia
- Frequency not known
  - Arthralgia
  - Depression
  - Erectile dysfunction
  - Henoeh-Schönlein purpura
  - Hyponatraemia
  - Myalgia
  - Pancreatitis
  - Photosensitivity
  - Hypothyroidism
  - Thrombocytopenia
  - Tinnitus
  - Vesiculitis

**HEPATIC IMPAIRMENT**
Avoid—no information available.

**RENAL IMPAIRMENT**
Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include berry-citrus.

**MEDIcINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral suspension**
- **Cozaar (Merck Sharp & Dohme Ltd)**
  - Losartan potassium 2.5 mg per 1 ml Cozaar 2.5mg/ml oral suspension sugar-free | 200 ml [POM] £53.68 DT price = £53.68

  - **Tablet**
    - **Losartan potassium (Non-proprietary)**
      - Losartan potassium 12.5 mg Losartan 12.5mg tablets | 28 tablet [POM] £30.00 DT price = £26.66
      - Losartan potassium 25 mg Losartan 25mg tablets | 28 tablet [POM] £16.18 DT price = £9.80
      - Losartan potassium 50 mg Losartan 50mg tablets | 28 tablet [POM] £12.80 DT price = £0.86

**INDICATIONS AND DOSE**

**Resistant hypertension (adjunct)**

▶ **BY MOUTH**

- Neonate: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 2–3 mg/kg every 8 hours.

**UNLICENSED USE**
Not licensed for use in children.

**CONTRA-INDICATIONS**
- Acute porphyrias p. 577 · cor pulmonale · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia

**CAUTIONS**
Cerebrovascular disease · occasionally blood pressure reduction too rapid even with low parenteral doses

**INTERACTIONS**
→ Appendix 1: hydralazine

**SIDE-EFFECTS**
- Rare Rash
- **Frequency not known** Abnormal liver function · agitation · anorexia · anxiety · arthralgia · blood disorders · dizziness · dyspnoea · fever · fluid retention · flushing · gastro-intestinal disturbances · haematuria · haemolytic anaemia · headache · hypotension · increased lacticemia · jaundice · leucopenia · myalgia · nasal congestion · palpitation · paraesthesia · peripheral neuritis · polyneuritis · proteinuria · raised plasma creatinine · systemic lupus erythematosus-like syndrome after long-term therapy (especially in slow acetylator individuals) · tachycardia · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

The incidence of side-effects is lower if the dose is kept low, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

**PREGNANCY**
Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

**BREAST FEEDING**
Present in milk but not known to be harmful. Monitor infant in breast-feeding.

**HEPATIC IMPAIRMENT**
Reduce dose.

**RENAL IMPAIRMENT**
Reduce dose if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

**MONITORING REQUIREMENTS**
Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose, but evidence of clinical value unsatisfactory.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use For administration by mouth, diluted injection may be given orally.
With intravenous use For continuous intravenous infusion, initially reconstitute 20 mg with 1 mL. Water for Injections, then dilute with Sodium Chloride 0.9%. Incompatible with Glucose intravenous infusion. For intravenous injection, initially reconstitute 20 mg with 1 mL. Water for Injections, then dilute to a concentration of 0.5–1 mg/mL with Sodium Chloride 0.9% and administer over 5–20 minutes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

EXCIPIENTS: May contain Gluten, propylene glycol

• Hydralazine hydrochloride (Non-proprietary)
  Hydralazine hydrochloride 10 mg Apo-Hydralazine 10mg tablets | 100 tablet (Pom) no price available
  Hydralazine hydrochloride 25 mg Hydralazine 25mg tablets | 56 tablet (Pom) £8.92 DT price = £6.60 | 84 tablet (Pom) £14.00
  Hydralazine hydrochloride 50 mg Hydralazine 50mg tablets | 56 tablet (Pom) £16.82 DT price = £12.45

• Apresoline (AMCo)
  Hydralazine hydrochloride 25 mg Apresoline 25mg tablets | 84 tablet (Pom) £3.38

Powder for solution for injection

• Hydralazine hydrochloride (Non-proprietary)
  Hydralazine hydrochloride 20 mg Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule (Pom) £64.50

• Apresoline (AMCo)
  Hydralazine hydrochloride 20 mg Apresoline 20mg powder for solution for injection ampoules | 5 ampoule (Pom) £11.09

Minoxidil

INDICATIONS AND DOSE
Severe hypertension

BY MOUTH

• Child 1 month–11 years: Initially 200 micrograms/kg/day in 1–2 divided doses, then increased in steps of 100–200 micrograms/kg, increased at intervals of at least 3 days; maximum 1 mg/kg per day

• Child 12–17 years: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg daily, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Acute porphyrias p. 577

INTERACTIONS Appendix 1: minoxidil

PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

BREAST FEEDING Present in milk but not known to be harmful.

RENAL IMPAIRMENT Use with caution in significant impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

• Loniten (Pfizer Ltd)
  Minoxidil 2.5 mg Loniten 2.5mg tablets | 60 tablet (Pom) £8.88 DT price = £8.88
  Minoxidil 5 mg Loniten 5mg tablets | 60 tablet (Pom) £15.83 DT price = £15.83
  Minoxidil 10 mg Loniten 10mg tablets | 60 tablet (Pom) £30.68 DT price = £30.68

4.1a Hypertension associated with phaeochromocytoma

VASODILATORS PERIPHERAL VASODILATORS

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE
Hypertension in phaeochromocytoma

BY MOUTH

• Child: 0.5–1 mg/kg twice daily, adjusted according to response

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS History of cerebrovascular accident

CAUTIONS Avoid contact with skin (risk of contact sensitisation) - avoid in acute porphyrias p. 577 - carcinogenic in animals - cerebrovascular disease - congestive heart failure - severe ischaemic heart disease

SIDE-EFFECTS

• Rare Gastro-intestinal disturbances

• Frequency not known Inhibition of ejaculation - lassitude - miosis - nasal congestion - postural hypotension (with dizziness and marked compensatory tachycardia)

PREGNANCY Hypotension may occur in newborn.

BREAST FEEDING May be present in milk.

RENAL IMPAIRMENT Use with caution.

DIRECTIONS FOR ADMINISTRATION For administration by mouth, capsules may be opened.

HANDLING AND STORAGE Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

• Phenoxybenzamine hydrochloride (Non-proprietary)
  Phenoxybenzamine hydrochloride 10 mg Phenoxybenzamine 10mg capsules | 30 capsule (Pom) £97.38 DT price = £97.38

4.1b Hypertensive crises

Other drugs used for Hypertensive crises Esmolol hydrochloride, p. 103 · Labetalol hydrochloride, p. 101

VASODILATORS VASODILATOR ANTIHYPERTENSIVES

Sodium nitroprusside

INDICATIONS AND DOSE
Hypertensive emergencies

BY CONTINUOUS INTRAVENOUS INFUSION

• Neonate: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours.

• Child: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours

UNLICENSED USE Not licensed for use in the UK.
4.1c Pulmonary hypertension

ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

Epoprostenol

(Prostacyclin)

Drug Action
Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

Indications and Dose
Persistent pulmonary hypertension of the newborn

- BY CONTINUOUS INTRAVENOUS INFUSION

- Neonate: Initially 2 nanograms/kg/minute (max. per dose 20 nanograms/kg/minute), adjusted according to response, rarely doses up to 40 nanograms/kg/minute are used.

Idiopathic pulmonary arterial hypertension

- BY CONTINUOUS INTRAVENOUS INFUSION

- Child: Initially 2 nanograms/kg/minute, increased if necessary up to 40 nanograms/kg/minute

Pharmacokinetics
Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

Unlicensed Use
Not licensed for use in children.

Contra-Indications
Pulmonary veno-occlusive disease - severe left ventricular dysfunction

Caution
Avoid abrupt withdrawal (risk of rebound pulmonary hypertension/pulmonary hypertensive crisis) - haemorrhagic diathesis

Interactions
Appendix 1: epoprostenol

Side-Effects
- Common or very common Abdominal pain - anxiety - arthralgia - bleeding - bradycardia - chest pain - diarrhoea - flushing - headache - hypotension - jaw pain - nausea - sepsis - tachycardia - vomiting
- Uncommon Dry mouth - pulmonary oedema - sweating
- Rare Agitation - pallor
- Frequency not known Serious systemic hypotension

Pregnancy
Manufacturer advises caution - no information available.

Breastfeeding
Manufacturer advises avoid — no information available.

Monitoring Requirements
- Anticoagulant monitoring required when given with anticoagulants.
- Monitor blood pressure.

Treatment Cessation
Avoid abrupt withdrawal (risk of rebound pulmonary hypertension and pulmonary hypertensive crisis).

Directions for Administration
Reconstitute using the glycine buffer diluent provided to make a concentrate (pH 10.5); filter the concentrate using the filter provided. The concentrate can be administered via a central venous catheter, alternatively it may be diluted further either with the glycine buffer diluent or to a minimum concentration of 1.43 micrograms/mL with Sodium Chloride 0.9%. Solution stable for 12 hours at room temperature, although some units use for 24 hours and allow for loss of potency; solution stable for 24 hours if prepared in glycine buffer diluent only and administered via an ambulatory cold pouch system (to maintain solution at 2–8°C). Neonatal intensive care, prepare a filtered concentrate of 10 micrograms/mL using the 500-microgram vial. Neonate body-weight under 2 kg, using the concentrate, dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Neonate body-weight over 2 kg, using the concentrate, dilute 60 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 2 nanograms/kg/minute.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Veletri (Actelion Pharmaceuticals UK Ltd)
  - Epoprostenol (as Epoprostenol sodium) 500 microgram Veletri 500microgram powder for solution for infusion vials | 1 vial £24.44
  - Epoprostenol (as Epoprostenol sodium) 1.5 mg Veletri 1.5mg powder for solution for infusion vials | 1 vial £49.24
116 Blood pressure conditions

Cardiovascular system

Powder and solvent for solution for infusion
- **Flolan** (GlaxoSmithKline UK Ltd)

  **Epoprostol (as Epoprostol sodium) 500 microgram**
  Flolan 500microgram powder and solvent (pH10.5) for solution for infusion vials | 1 vial [GBP] £22.22
  Flolan 500microgram powder and solvent (pH12) for solution for infusion vials | 1 vial [GBP] £22.22

  **Epoprostol (as Epoprostol sodium) 1.5 mg**
  Flolan 1.5mg powder and solvent (pH10.5) for solution for infusion vials | 1 vial [GBP] £44.76
  Flolan 1.5mg powder and solvent (pH12) for solution for infusion vials | 1 vial [GBP] £44.76

Iloprost

**INDICATIONS AND DOSE**

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 8-17 years: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

Raynaud’s syndrome

- **BY INTRAVENOUS INFUSION**
  - Child 12-17 years: Initially 30 nanograms/kg/hour, increased to 60–120 nanograms/kg/hour daily for 3–5 days, dose to be given over 6 hours, dose increase should be performed gradually

**UNLICENSED USE**

Not licensed for use in children.

**CONTRA-INDICATIONS**

Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompensated cardiac failure (unless under close medical supervision) - pulmonary veno-occlusive disease - severe arrhythmias - severe coronary heart disease

**CAUTIONS**

**GENERAL CAUTIONS**

Hypotension (do not initiate if systolic blood pressure below 85 mmHg) - unstable pulmonary hypertension with advanced right heart failure

**SPECIFIC CAUTIONS**

- When used by inhalation Acute pulmonary infection - severe asthma
- **INTERACTIONS** → Appendix 1: iloprost
- **SIDE-EFFECTS**
  - Common or very common Chest pain - cough - diarrhoea - dyspnoea - haemorrhage - headache - hypotension - jaw pain - nausea - oral irritation - rash - throat pain - vomiting
  - Frequency not known Bronchospasm - taste disturbance - thrombocytopenia - wheezing

**PREGNANCY**

When used by inhalation Use if potential benefit outweighs risk.

**BREAST FEEDING**

When used by inhalation Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Dose may need to be halved in liver cirrhosis.

- When used by inhalation Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For *intravenous infusion* dilute to a concentration of 200 nanograms/mL with Glucose 5% or Sodium Chloride 0.9%; alternatively, may be diluted to a concentration of 2 micrograms/mL and given via syringe driver.

- When used by inhalation For *inhaled treatment*, to minimise accidental exposure use only with nebulisers listed in *Ventavis*® product literature in a well ventilated room.

**PRESCRIBING AND DISPENSING INFORMATION**

- When used by inhalation Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.
- With intravenous use Concentrate for infusion available on a named patient basis from Bayer Schering in 0.5 mL and 1 mL ampoules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**

- **Ventavis** (Bayer Plc)
  - Iloprost (as Iloprost trometamol) 10 microgram per 1 ml Ventavis 10micrograms/ml nebuliser solution 1ml ampoules | 30 ampoule [GBP] £40.19 | 168 ampoule [GBP] £2,241.08

ENDOTHELIN RECEPTOR ANTAGONISTS

Bosentan

**INDICATIONS AND DOSE**

Pulmonary arterial hypertension (initiated under specialist supervision)

- **BY MOUTH**
  - Child 2-17 years (body-weight 10–20 kg): Initially 31.25 mg once daily for 4 weeks, then increased to 31.25 mg twice daily
  - Child 2-17 years (body-weight 20–40 kg): Initially 31.25 mg twice daily for 4 weeks, then increased to 62.5 mg twice daily
  - Child 12-17 years (body-weight 40 kg and above): Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg)

- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg
- **INTERACTIONS** → Appendix 1: bosentan
- **SIDE-EFFECTS**
  - Common or very common Anaemia - diarrhoea - flushing - gastro-oesophageal reflux - headache - hypotension - oedema - palpitation - syncope
  - Uncommon Leucopenia - neutropenia - thrombocytopenia
  - Rare Liver cirrhosis - liver failure

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

**PREGNANCY**

Avoid (teratogenic in animal studies).

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Avoid in moderate and severe impairment.

**MONITORING REQUIREMENTS**

Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).

- Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.

**TREATMENT CESSATION**

Avoid abrupt withdrawal—withdraw treatment gradually.

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be cut, or suspended in water or non-acidic liquid. Suspension is stable at room-temperature (max. 25°C) for 24 hours.
PHOSPHODIESTERASE TYPE-5 INHIBITORS

Sildenafil

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension (initiated under specialist supervision)**

- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
  - Child 1–11 months: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
  - Child 1–17 years (body-weight up to 20 kg): 10 mg 3 times a day.
  - Child 1–17 years (body-weight 20 kg and above): 20 mg 3 times a day.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose with concurrent use of moderate and potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir)—no specific recommendation made for children.

**UNLICENSED USE**

- Not licensed for use in children under 1 year.
- Hereditary degenerative retinal disorders - history of non-articritical anterior ischaemic optic neuropathy - recent history of stroke - sickle-cell anaemia

**CONTRA-INDICATIONS**

- Active peptic ulceration - anatomical deformation of the penis - autonomic dysfunction - bleeding disorders - cardiovascular disease - hypotension (avoid if severe) - intravascular volume depletion - left ventricular outflow obstruction - ocular disorders - predisposition to priapism - pulmonary veno-occlusive disease

**INTERACTIONS**

- Appendix 1: phosphodiesterase type-5 inhibitors

**SIDE-EFFECTS**

- Uncommon - Gynaecomastia - haematuria - penile haemorrhage - priapism

- Frequency not known - Non-articritical anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) - sudden hearing loss (advise patient to seek medical help) - rash - retinal vascular occlusion

**PREGNANCY**

- Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- Reduce dose if not tolerated in mild to moderate impairment. Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT**

- Reduce dose if not tolerated

**TREATMENT CESSATION**

- Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Sildenafil for pulmonary hypertension [www.medicinesforchildren.org.uk/sildenafil-for-pulmonary-hypertension]

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

- The Scottish Medicines Consortium has advised (October 2012) that sildenafil (Revatio®) is accepted for restricted use within NHS Scotland for the treatment of pulmonary arterial hypertension in children aged 1–17 years; sildenafil should only be prescribed on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Sildenafil**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Sildenafil (Non-proprietary)**
  - Sildenafil (as Sildenafil citrate) 20 mg Sildenafil 20mg tablets | 90 tablet (Pf) £379.38-£424.0L
  - **Revatio® (Pfizer Ltd)**
  - Sildenafil (as Sildenafil citrate) 20 mg Revatio 20mg tablets | 90 tablet (Pf) £446.33

**Oral suspension**

- **Revatio® (Pfizer Ltd)**
  - Sildenafil (as Sildenafil citrate) 10 mg per 1 ml Revatio 10mg/ml oral suspension sugar-free | 112 ml (Pf) £186.75

**VASODILATORS > PERIPHERAL VASODILATORS**

**Tolazoline**

**INDICATIONS AND DOSE**

**Correction of pulmonary vasospasm in neonates**

- Initially by intravenous injection
  - Neonate: Initially 1 mg/kg, to be given over 2–5 minutes, followed by (by continuous intravenous infusion) maintenance 200 micrograms/kg/hour if required, careful blood pressure monitoring should be carried out, doses above 300 micrograms/kg/hour associated with cardiotoxicity and renal failure.

- **By endotracheal tube**

**UNLICENSED USE**

- Not licensed for use in children.

**CONTRA-INDICATIONS**

- Peptic ulcer disease

**CAUTIONS**

- Cardiotoxic accumulation may occur with continuous infusion (particularly in renal impairment) - mitral stenosis

**SIDE-EFFECTS**

- Blood dyscrasias - blotchy skin - cardiac arrhythmias - diarrhoea - epigastric pain - flushing - haematuria - haemorrhage (with high doses) - headache - marked hypertension (with high doses) - metabolic alkalosis - nausea - oliguria - renal failure (with high doses) - severe hypotension (with high doses) - shivering - sweating - tachycardia - thrombocytopenia - vomiting

**RENAL IMPAIRMENT**

- Lower doses may be necessary. Accumulates in renal impairment. Risk of cardiotoxicity.

**MONITORING REQUIREMENTS**

- Monitor blood pressure regularly for sustained systemic hypotension.
Blood pressure conditions

- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%. Prepare a fresh solution every 24 hours. For endotracheal administration, dilute with 0.5–1 mL of Sodium Chloride 0.9%.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### 4.2 Hypotension and shock

#### Sympathomimetics

**Overview**

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Response to sympathomimetics can also vary considerably in children, particularly neonates. It is important to titrate the dose to the desired effect and to monitor the child closely.

**Inotropic sympathomimetics**

Dopamine hydrochloride p. 119 has a variable, unpredictable, and dose dependent impact on vascular tone. Low dose infusion normally causes vasodilatation, but there is little evidence that this is clinically beneficial; moderate doses increase myocardial contractility and cardiac output in older children, but in neonates moderate doses may cause a reduction in cardiac output. High doses cause vasoconstriction and increase vascular resistance, and should therefore be used with caution following cardiac surgery, or where there is co-existing neonatal pulmonary hypertension.

In neonates the response to inotropic sympathomimetics varies considerably, particularly in those born prematurely; careful dose titration and monitoring are necessary.

Isoprenaline injection is available from ‘special-order’ manufacturers or specialist importing companies.

**Shock**

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis or myocardial insufficiency should be corrected. Additional treatment is dependent on the type of shock.

- **Septic shock** is associated with severe hypovolaemia (due to vasodilation and capillary leak) which should be corrected with crystalloids or colloids. If hypotension persists despite volume replacement, dopamine hydrochloride should be started. For shock refractory to treatment with dopamine hydrochloride, if cardiac output is high and peripheral vascular resistance is low (warm shock), noradrenaline/norepinephrine p. 120 should be added or if cardiac output is low and peripheral vascular resistance is high (cold shock), adrenaline/epinephrine p. 132 should be added. Additionally, in cold shock, a vasodilator such as milrinone p. 124, glyceryl trinitrate p. 132, or sodium nitroprusside p. 114 (on specialist advice only) can be used to reduce vascular resistance.

- If the shock is resistant to volume expansion and catecholamines, and there is suspected or proven adrenal insufficiency, low dose hydrocortisone p. 420 can be used. ACTH-stimulated plasma-cortisol concentration should be measured; however, hydrocortisone can be started without such information. Alternatively, if the child is resistant to catecholamines, and vascular resistance is low, vasopressin p. 65 can be added.

- **Neonatal septic shock** can be complicated by the transition from fetal to neonatal circulation. Treatment to reverse right ventricular failure, by decreasing pulmonary artery pressures, is commonly needed in neonates with fluid-refractory shock and persistent pulmonary hypertension of the newborn. Rapid administration of fluid in neonates with patent ductus arteriosus may cause left-to-right shunting and congestive heart failure induced by ventricular overload.

  In **cardiogenic shock**, the aim is to improve cardiac output and to reduce the afterload on the heart. If central venous pressure is low, cautious volume expansion with a colloid or crystalloid can be used. An inotrope such as adrenaline/epinephrine or dopamine hydrochloride should be given to increase cardiac output. Dobutamine p. 119 is a peripheral vasodilator and is an alternative if hypotension is not significant.

  Milrinone has both inotropic and vasodilatory effects and can be used when vascular resistance is high. Alternatively, glyceryl trinitrate or sodium nitroprusside (on specialist advice only) can be used to reduce vasoconstriction.

**Hypovolaemic shock** should be treated with a crystalloid or colloid solution (or whole or reconstituted blood if source of hypovolaemia is haemorrhage) and further steps to improve cardiac output and decrease vascular resistance can be taken, as in cardiogenic shock.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 165.

#### Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

- Ephedrine hydrochloride p. 120 is used to reverse hypotension caused by spinal and epidural anaesthesia.

- Metaraminol p. 120 is used as a vasopressor during cardiopulmonary bypass.

- Phentolamine hydrochloride p. 121 causes peripheral vasoconstriction and increases arterial pressure.

- Ephedrine hydrochloride, metaraminol and phentolamine hydrochloride are rarely needed in children and should be used under specialist supervision.

Noradrenaline/norepinephrine is reserved for children with low systemic vascular resistance that is unresponsive to fluid resuscitation following septic shock, spinal shock, and anaphylaxis.

Adrenaline/epinephrine is mainly used for its inotropic action. Low doses (acting on beta receptors) cause systemic and pulmonary vasodilation, with some increase in heart rate and stroke volume and also an increase in contractility; high doses act predominantly on alpha receptors causing intense systemic vasoconstriction.
Dobutamine

**DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**INDICATIONS AND DOSE**

- **Inotropic support in low cardiac output states, after cardiac surgery, cardiomyopathies, shock**
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
  - **Neonate:** Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.
  - **Child:** Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS**
- Acute heart failure - acute myocardial infarction - arrhythmias - correct hypercapnia before starting and during treatment - correct hypovolaemia before starting and during treatment - correct hypoxia before starting and during treatment - correct metabolic acidosis before starting and during treatment - diabetes mellitus - extravasation may cause tissue necrosis - extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) - hyperthyroidism - ischaemic heart disease - occlusive vascular disease - severe hypotension - susceptibility to angle-closure glaucoma - tachycardia - tolerance may develop with continuous infusions longer than 72 hours

**INTERACTIONS** → Appendix 1: Sympathomimetics, inotropic

**SIDE-EFFECTS**
- Rare: Psychosis
- Very rare: Angle-closure glaucoma - AV block - bradycardia - cardiac arrest - coronary artery spasm - hypokalaemia - myocardial infarction - petechial bleeding

**FREQUENCY not known**
- Anxiety - arrhythmias - bronchospasm - cerebral haemorrhage - chest pain - dyspnœa - eosinophilia - fever - headache - hypertension (marked increase in systolic blood pressure indicates overdose) - hypotension - increased urinary urgency - myoclonic spasm - nausea - palpitation - paraesthesia - phlebitis - pruritus of scalp - pulmonary oedema - rash - reduced platelet aggregation (on prolonged use) - tachycardia - tremor - vomiting

**PREGNANCY** No evidence of harm in animal studies—manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

For **continuous intravenous infusion**, using infusion pump, dilute to a concentration of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

**Neonatal intensive care**, dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.5 mL/hour provides a dose of 5 micrograms/kg/minute; max. concentration of 5 mg/mL; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **EXCIPIENTS:** May contain Sulphites
  - Dobutamine (Non-proprietary)
    - Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial £7.20
    - Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 1 ampoule £26.00–£26.25

Dopamine hydrochloride

**DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**INDICATIONS AND DOSE**

To correct the haemodynamic imbalance due to acute hypotension, shock, cardiac failure, adjunct following cardiac surgery

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - **Neonate:** Initially 3 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.
  - **Child:** Initially 5 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.

**UNLICENSED USE** Not licensed for use in children under 12 years.

**CONTRA-INDICATIONS** Phaeochromocytoma - tachyarrhythmia

**CAUTIONS** Correct hypovolaemia - hypertension (may raise blood pressure) - hyperthyroidism

**INTERACTIONS** → Appendix 1: Sympathomimetics, inotropic

**SIDE-EFFECTS**
- Common or very common: Chest pain - dyspnoea - headache - hypotension - nausea - palpitation - tachycardia - vasoconstriction - vomiting
- Uncommon: Bradycardia - gangrene - hypertension - mydriasis
- Rare: Fatal ventricular arrhythmias

**PREGNANCY** No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** May suppress lactation—not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.

For **continuous intravenous infusion**, dilute to a max. concentration of 3.2 mg/mL with Glucose 5% or Sodium Chloride 0.9%. Infuse higher concentrations through central venous catheter using a syringe pump to avoid extravasation and fluid overload. Incompatible with bicarbonate and other alkaline solutions.

**Neonatal intensive care**, dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute; max. concentration of 3.2 mg/mL; infuse higher concentrations through central venous catheter. Incompatible with bicarbonate and other alkaline solutions.
### MedicaL Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

#### Solution for infusion
- **Dopamine hydrochloride (Non-proprietary)**
  - **Dopamine hydrochloride 40 mg per 1 ml** Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule (PO) £20.00 |
  - **Dopamine 200mg/5ml concentrate for solution for infusion ampoules** | 10 ampoule (PO) no price available
- **Dopamine hydrochloride 160 mg per 1 ml** Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule (PO) £34.00

### SYMPATHOMIMETICS
#### Ephedrine hydrochloride

#### Indications and Dose
**Reversal of hypotension from spinal or epidural anaesthesia**
- **By slow intravenous injection**
  - Child 1-11 years: 500–750 micrograms/kg every 3–4 minutes, adjusted according to response, alternatively 17–25 mg/m² every 3–4 minutes, adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course
  - Child 12-17 years: 3–7.5 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course

#### CautionS
- **Diabetes mellitus** • **Hypertension** • **Hypothyroidism** • Susceptibility to angle-closure glaucoma

#### Interactions
- Appendix 1: sympathomimetics, vasoconstrictor

#### Side-Effects
- **Common or very common** Anginal pain • anorexia • anxiety • arrhythmias • changes in blood-glucose concentration • confusion • difficulty in micturition • dizziness • dyspnœa • flushing • headache • hypersalivation • insomnia • nausea • paleness • restlessness • sweating • tachycardia • tremor • urinary retention • vasoconstriction with hypertension • vasoconstriction with hypotension • vomiting •
- **Very rare** Angle-closure glaucoma
- Frequency not known Bradycardia • increased lacrimation (can have adverse effects on contact lens wear)
- **Pregnancy** Increased fetal heart rate reported with parenteral ephedrine.
- **Breast Feeding** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **Renal Impairment** Use with caution.
- **Directions for Administration** For slow intravenous injection, give via central venous catheter using a solution containing ephedrine hydrochloride 3 mg/ml.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- **Ephedrine hydrochloride (Non-proprietary)**
  - **Ephedrine hydrochloride 3 mg per 1 ml** Ephedrine 30mg/10ml solution for injection ampoules | 10 ampoule (PO) £76.87
  - **Ephedrine 30mg/10ml solution for injection pre-filled syringes** | 1 pre-filled disposable injection (PO) £7.59–£9.50 | 12 pre-filled disposable injection (PO) £114.00
  - **Ephedrine hydrochloride 30 mg per 1 ml** Ephedrine 30mg/1ml solution for injection ampoules | 10 ampoule (PO) £4.98–£5.03

### Noradrenaline/norepinephrine

#### Indications and Dose
**Acute hypotension (septic shock) | Shock secondary to excessive vasodilation (as noradrenaline)**
- **By continuous intravenous infusion**
  - Neonate: 20–100 nanograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response.
  - Child: 20–100 nanograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response

#### Unlicensed Use
Not licensed for use in children.

#### Contra-Indications
Hypertension

#### CautionS
- Cirrhosis • coronary vascular thrombosis • diabetes mellitus • extravasation at injection site may cause necrosis • following myocardial infarction • hypercapnia • hypertension • hypoxia • mesenteric vascular thrombosis • peripheral vascular thrombosis • Prinzmetal’s variant angina • susceptibility to angle-closure glaucoma • uncorrected hypovolaemia

#### CautionS, Further Information
- Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

#### Interactions
- Appendix 1: sympathomimetics, vasoconstrictor

#### Side-Effects
- Angle-closure glaucoma • anorexia • anxiety • arrhythmias • bradycardia • confusion • dyspnœa • fatal ventricular arrhythmia reported in Laennec’s cirrhosis • headache • hypertension • hypoxia • insomnia • nausea • palpitation • peripheral ischaemia • psychosis • tachycardia • tremor • urinary retention • vomiting • weakness

#### Pregnancy
- May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.

#### Breast Feeding
- Manufacturer advises caution—no information available.

#### Monitoring Requirements
Monitor blood pressure and rate of flow frequently.

#### Directions for Administration
For intravenous infusion, dilute to a concentration of 30–200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter.

#### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

#### Solution for injection
- **Metaraminol (Non-proprietary)**
  - Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule (PO) £31.97

---

**BNFC 2017–2018**

**Cardiovascular system**

**120 Blood pressure conditions**

---
Phenylephrine hydrochloride

**INDICATIONS AND DOSE**

**Acute hypotension**

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-11 years: 100 micrograms/kg every 1–2 hours (max. per dose 5 mg) as required
  - Child 12-17 years: Initially 2–5 mg (max. per dose 5 mg), followed by 1–10 mg, after at least 15 minutes if required
  - BY SLOW INTRAVENOUS INJECTION
    - Child 1-11 years: Initially 5–20 micrograms/kg (max. per dose 500 micrograms), repeated as necessary after at least 15 minutes
    - Child 12-17 years: 100–500 micrograms, repeated as necessary after at least 15 minutes
  - **BY INTRAVENOUS INFUSION**
    - Child 1-15 years: Initially 100–500 nanograms/kg/minute, adjusted according to response
    - Child 16-17 years: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

**UNLICENSED USE**

- Not licensed for use in children by intravenous infusion or injection.

**CONTRA-INDICATIONS**

- Hypertension—severe hyperthyroidism

**CAUTIONS**

- Coronary disease—coronary vascular thrombosis—diabetes—extravasation at injection site may cause necrosis—following myocardial infarction—hypercapnia—hyperthyroidism—hypoxia—mesenteric vascular thrombosis—peripheral vascular thrombosis—Prinzmetal’s variant angina—susceptibility to angle-closure glaucoma—uncorrected hypovolaemia

**INTERACTIONS**

- sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**

**PREGNANCY**

- Avoid—may reduce placental perfusion.

**MONITORING REQUIREMENTS**

- Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION**

For continuous intravenous infusion, dilute to a max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

**Neonatal intensive care**, dilute 600 micrograms/base/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 nanograms/base/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid-restricted). Discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

**PRESCRIBING AND DISPENSING INFORMATION**

For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for infusion**

- Noradrenaline/norepinephrine (Non-proprietary)
  - Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 ml Noradrenaline (Norepinephrine) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule (£/amp) £44.00
  - Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule (£/amp) £116.00
  - Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule (£/amp) £12.00 (Hospital only)
  - Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule (£/amp) £22.00 (Hospital only)
  - Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule (£/amp) £58.00
  - Noradrenaline (Norepinephrine) 2mg/2ml concentrate for solution for Infusion ampoules | 5 ampoule (£/amp) £11.00

**UNLICENSED USE**

- Not licensed for use in children by intravenous infusion or injection.

**CONTRA-INDICATIONS**

- Hypertension—severe hyperthyroidism

**CAUTIONS**

- Coronary disease—coronary vascular thrombosis—diabetes—extravasation at injection site may cause necrosis—following myocardial infarction—hypercapnia—hyperthyroidism—hypoxia—mesenteric vascular thrombosis—peripheral vascular thrombosis—Prinzmetal’s variant angina—susceptibility to angle-closure glaucoma—uncorrected hypovolaemia

**INTERACTIONS**

- sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**

**PREGNANCY**

- Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.

**MONITORING REQUIREMENTS**

- Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous injection, dilute to a concentration of 1 mg/mL with Water for Injections and administer slowly. For intravenous infusion, dilute to a concentration of 20 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and administer as a continuous infusion via a central venous catheter using a controlled infusion device.

**PRESCRIBING AND DISPENSING INFORMATION**

- Intravenous administration preferred when managing acute hypotension in children.
Heart failure

Other drugs used for Heart failure
Bendroflumethiazide, p. 107 • Captopril, p. 109 • Chlortalidone, p. 108 • Chlortalidone, p. 138 • Digoxin, p. 79 • Enalapril maleate, p. 110 • Glyceryl trinitrate, p. 132 • Lisinopril, p. 111

DIURETICS ▶ POTASSIUM-SPARING DIURETICS ▶ ALDOSTERONE ANTAGONISTS

Potassium canrenoate

INDICATIONS AND DOSE
Short-term diuresis for oedema in heart failure and in ascites
▶ By intravenous injection, or by intravenous infusion
• Neonate: 1–2 mg/kg twice daily.
• Child 1 month–11 years: 1–2 mg/kg twice daily
• Child 12–17 years: 1–2 mg/kg twice daily (max. per dose 200 mg)

DOSE EQUIVALENCE AND CONVERSION
▶ To convert to equivalent oral spironolactone dose, multiply potassium canrenoate dose by 0.7.

UNLICENSED USE
Not licensed for use in the UK.

CONTRA-INDICATIONS
Hyperkalaemia • hyponatraemia

CAUTIONS
Acute porphyrias p. 577 • hypotension • potential metabolic products carcinogenic in rodents

INTERACTIONS
Appendix 1: potassium canrenoate

SIDE-EFFECTS
▶ Common or very common
• Ataxia • drowsiness • headache • hyperuricaemia • menstrual irregularities • pain at injection site on rapid administration
• Uncommon
• Eosinophilia • hyperkalaemia • thombocytopenia
• Rare
• Agranulocytosis • alopecia • deepening of voice • erythema • hepatotoxicity • hoarseness • hypersensitivity reactions • osteomalacia • urticaria
• Frequency not known
• Gastro-intestinal disturbances • gynaecomastia • hirsutism • hypochloremic acidosis • hyponatraemia • hypotension • mastalgia • transient confusion with high doses

PREGNANCY
Crosses placenta. Feminisation and undescended testes in male fetus in animal studies—manufacturer advises avoid.

BREAST FEEDING
Present in breast milk—manufacturer advises avoid.

RENAL IMPAIRMENT
Use with caution if estimated glomerular filtration rate 30–60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Monitor plasma-potassium concentration if estimated glomerular filtration rate 30–60 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor electrolytes (discontinue if hyperkalaemia occurs).

DIRECTIONS FOR ADMINISTRATION
Consult product literature. Intravenous injection to be given over at least 3 minutes.

PRESCRIBING AND DISPENSING INFORMATION
Potassium canrenoate injection is available from “special-order” manufacturers or specialist importing companies.
### Spironolactone

**INDICATIONS AND DOSAGE**

**Oedema in heart failure and in ascites | Nephrotic syndrome | Reduction of hypokalaemia induced by diuretics or amphotericin**

- **By Mouth**
  - **Neonate:** Initially 1–2 mg/kg daily in 1–2 divided doses; increased if necessary up to 7 mg/kg daily, in resistant ascites.
  - **Child 1 month–11 years:** Initially 1–3 mg/kg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites.
  - **Child 12–17 years:** Initially 50–100 mg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites; maximum 400 mg per day.

**UNLICENSED USE** Not licensed for reduction of hypokalaemia induced by diuretics or amphotericin.

**CONTRA-INDICATIONS** Addison’s disease • anuria • hyperkalaemia

**CAUTIONS** Acute porphyrias p. 577 • potential metabolic products carcinoogenic in rodents

**INTERACTIONS** [Appendix 1: aldosterone antagonists

**SIDE-EFFECTS** Acute renal failure • agranulocytosis • alopecia • benign breast tumour • breast pain • changes in libido • confusion • dizziness • drowsiness • electrolyte disturbances • gastro-intestinal disturbances • gynaecomastia • hepatotoxicity • hyperkalaemia (discontinue) • hypertrichosis • hyperuricaemia • hyponautraemia • leg cramps • leucopenia • malaise • menstrual disturbances • rash • Stevens–Johnson syndrome • thrombocytopenia

**PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in animal studies.

**BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.

**RENAL IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs.

**PATIENT AND CARER ADVICE** Medicines for Children leaflet: Spironolactone for heart failure www.medicinesforchildren.org.uk/spironolactone-for-heart-failure

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - Spironolactone (Non-proprietary)
    - **Spironolactone 25 mg** Spironolactone 25mg tablets | 28 tablet POM £3.50 DT price + £1.30
    - **Spironolactone 50 mg** Spironolactone 50mg tablets | 28 tablet POM £6.00 DT price + £1.70
    - **Spironolactone 100 mg** Spironolactone 100mg tablets | 28 tablet POM £6.24 DT price + £2.00 | 30 tablet POM no price available

**PHOSPHODIESTERASE TYPE-3 INHIBITORS**

### Enoximone

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSAGE**

**Congestive heart failure, low cardiac output following cardiac surgery**

- **Initially by slow intravenous injection**
  - **Neonate:** Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion to be given over 24 hours; maximum 24 mg/kg per day.
  - **Child:** Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion dose to be given over 24 hours; maximum 24 mg/kg per day.

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**SIDE-EFFECTS** Chills • diarrhoea • ectopic beats • fever • headache • hypotension • insomnia • nausea • oliguria • supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) • upper and lower limb pain • urinary retention • ventricular tachycardia (more likely in patients with pre-existing arrhythmias) • vomiting

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT** Dose reduction may be required.

**RENAL IMPAIRMENT** Consider dose reduction.

**MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

For intravenous administration, dilute to concentration of 2.5 mg/mL with Sodium Chloride 0.9% or Water for Injections; the initial loading dose should be given by slow intravenous injection over at least 15 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Phosphodiesterase type-3 inhibitors possess positive inotropic and vasodilator activity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase type-3 inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

**PATIENT AND CARER ADVICE** Medicines for Children leaflet: Enoximone for pulmonary hypertension www.medicinesforchildren.org.uk/enoximone-for-pulmonary-hypertension
124 Hyperlipidaemia

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Excipients**: May contain Alcohol, propylene glycol
- **Perfan (Myogen GmbH)**
  - Enoximone 5 mg per 1 mL Perfan 100mg/20mL solution for injection ampoules | 10 ampoule (£) no price available (Hospital only)

**Milrinone**

**Drug action**
Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**Indications and dose**
Congestive heart failure, low cardiac output following cardiac surgery, shock

- **Initially by intravenous infusion**
  - Neonate: Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).
  - Child: Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).

**Unlicensed use**
Not licensed for use in children.

**Contraindications**
Severe hypovolaemia

**Caution**
Correct hypokalaemia; heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**Side-effects**
- **Common or very common**
  - Ectopic beats, headache, hypotension, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias). Ventricular tachycardia.
  - Chest pain, hypokalaemia, thrombocytopenia, tremor, ventricular fibrillation.
  - Anaphylaxis, bronchospasm, rash.
- **Pregnancy**
  - Manufacturer advises use only if potential benefit outweighs risk.
- **Breast feeding**
  - Manufacturer advises avoid—no information available.
- **Renal impairment**
  - Use half to three-quarters normal dose and monitor response if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
- **Monitoring requirements**
  - Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
  - Monitor renal function.
- **Directions for administration**
  - Avoid extravasation.
  - For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9% or Sodium Chloride and Glucose intravenous infusion to a concentration of 200 micrograms/mL (higher concentrations of 400 micrograms/mL have been used).
  - Loading dose may be given undiluted if fluid-restricted.
- **Prescribing and dispensing information**
  - Phosphodiesterase type-3 inhibitors possess positive inotropic and vasodilator activity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase type-3 inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

**Hyperlipidaemia**

**Risk factors for cardiovascular disease**
Atherosclerosis begins in childhood and raised serum cholesterol in children is associated with cardiovascular disease in adulthood. Lowering the cholesterol, without hindering growth and development in children and adolescents, should reduce the risk of cardiovascular disease in later life.

The risk factors for developing cardiovascular disease include raised serum cholesterol concentration, smoking, hypertension, impaired glucose tolerance, male sex, ethnicity, obesity, triglyceride concentration, chronic kidney disease, and a family history of cardiovascular disease. Heterozygous familial hypercholesterolaemia is the most common cause of raised serum cholesterol in children; homozygous familial hypercholesterolaemia is very rare and its specialised management is not covered in BNF for Children. Familial hypercholesterolaemia can lead to a greater risk of early coronary heart disease and should be managed by a specialist.

Secondary causes of hypercholesterolaemia should be addressed, these include obesity, diet, diabetes mellitus, hypothyroidism, nephrotic syndrome, obstructive biliary disease, glycogen storage disease, and drugs such as corticosteroids.

**Management**
The aim of management of hypercholesterolaemia is to reduce the risk of atherosclerosis while ensuring adequate growth and development. Children with hypercholesterolaemia (or their carers) should receive advice on appropriate lifestyle changes such as improved diet, increased exercise, weight reduction, and not smoking; Hypertension p. 95 should also be managed appropriately. Drug therapy may also be necessary.

**Hypothyroidism**
Children with hypothyroidism should receive adequate thyroid replacement therapy before their requirement for lipid-regulating treatment is assessed because correction of hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid regulating drugs.

**Drug treatment in heterozygous familial hypercholesterolaemia**
Lifestyle modifications alone are unlikely to lower cholesterol concentration adequately in heterozygous familial hypercholesterolaemia and drug treatment is often required. Lipid-regulating drugs should be considered by the age of 10 years. The decision to initiate drug treatment will depend on the child’s age, the age of onset of coronary heart disease within the family, and the presence of other cardiovascular risk factors. In children with a family history of coronary heart disease in early adulthood, drug treatment before the age of 10 years, and a combination of lipid-regulating drugs may be necessary.
Drug treatment in secondary hypercholesterolaemia

If 6–12 months of dietary and other lifestyle interventions has failed to lower cholesterol concentration adequately, drug treatment may be indicated in children 10 years and older (rarely necessary in younger children) who are at a high risk of developing cardiovascular disease.

Choice of drugs

Experience in the use of lipid-regulating drugs in children is limited and they should be initiated on specialist advice.

- **Statins** are more effective than other classes of drugs in lowering LDL-cholesterol but less effective than the fibrates in reducing triglycerides. Statins also increase concentrations of HDL-cholesterol. Statins reduce cardiovascular disease events and total mortality in adults, irrespective of the initial cholesterol concentration. They are the drugs of first choice in children and are generally well tolerated; atorvastatin p. 128 and simvastatin p. 130 are the preferred statins. Other lipid-regulating drugs can be used if statins are ineffective or are not tolerated.

- **Ezetimibe** is licensed for the treatment of homozygous familial hypercholesterolaemia; it is used in combination with other lipid-lowering therapies.

- **Bile acid sequestrants** are also available but tolerability of and compliance with these drugs is poor, and their use is declining.

- **Fibrates** may reduce the risk of coronary heart disease in those with low HDL-cholesterol or with raised triglycerides. Evidence for the use of a fibrate (bezafibrate p. 126 or fenofibrate p. 127) in children is limited; fibrates should be considered only if dietary intervention and treatment with a statin and a bile acid sequestrant is unsuccessful or contra-indicated.

- In hypertriglyceridaemia which cannot be controlled by very strict diet, omega-3 fatty acid compounds can be considered.

### Lipid Modifying Drugs

#### Bile Acid Sequestrants

**Drug Action**
Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.

**Caution**
Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).

**Side-Effects**
Constipation • diarrhoea • gastrointestinal discomfort • hypertriglyceridaemia (aggravation) • hypoprothrombinemia associated with vitamin K deficiency • increased risk of bleeding • nausea • vomiting

**Pregnancy**
Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**Breast Feeding**
Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**Monitoring Requirements**
A child’s growth and development should be monitored.
Diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

- **BY MOUTH**
- Child 1–11 months: 1 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 9 g per day
- Child 1–5 years: 2 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 18 g per day
- Child 6–11 years: 4 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 24 g per day
- Child 12–17 years: 4–8 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 36 g per day

- **UNLICENSED USE** Not licensed for use in children under 6 years to reduce cholesterol.
- **CONTRA-INDICATIONS** Complete biliary obstruction (not likely to be effective)
- **INTERACTIONS** → Appendix 1: colestyramine
- **SIDE-EFFECTS**
  - Rare Intestinal obstruction
  - Frequency not known Hyperchloraemic acidosis (on prolonged use)
- **DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content.
  
  Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Powder**

Cautionary and Advisory Labels 13

- **Colestyramine (Non-proprietary)**
  - Colestyramine anhydrous 4 gram: Colestyramine 4 g oral powder sachets | 50 sachet £ 10.76 DT price = £ 10.76
  - Colestyramine 4 g oral powder sachets sugar free: 50 sachet £ 27.68–30.00 DT price = £ 27.68
  - Questran (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Colestyramine anhydrous 4 gram: Questran 4 g oral powder sachets | 50 sachet £ 16.15 DT price = £ 27.68
  - Questran Light (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Colestyramine anhydrous 4 gram: Questran Light 4 g oral powder sachets sugar-free | 50 sachet £ 27.68

**LIPID MODIFYING DRUGS** > CHOLESTEROL ABSORPTION INHIBITORS

**Ezetimibe**

- **DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol.

- **INDICATIONS AND DOSE**
  - Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia
  - Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia
  - Primary hypercholesterolaemia (if statin inappropriate or not tolerated)

- **BY MOUTH**
  - Child 10–17 years: 10 mg daily

- **INTERACTIONS** → Appendix 1: ezetimibe

- **SIDE-EFFECTS**
  - Common or very common Fatigue, gastro-intestinal disturbances, headache, myalgia
  - Rare Anaphylaxis, angioedema, arthralgia, hepatitis, hypersensitivity reactions, rash
  - Very rare Cholecytisits, cholelithiasis, myopathy, pancreatitis, raised creatine kinase, rhabdomyolysis, thrombocytopenia
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment—may accumulate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Ezetrol (Merck Sharp & Dohme Ltd)
  - Ezetimibe 10 mg: Ezetrol 10 mg tablets | 28 tablet DT price = £ 26.31

Combinations available: Simvastatin with ezetimibe, p. 130

**LIPID MODIFYING DRUGS** > FIBRATES

**Bezafibrate**

- **DRUG ACTION** Fibrate act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

- **INDICATIONS AND DOSE**
  - Hyperlipidaemia including familial hypercholesterolaemia (administered on expert advice)

- **BY MOUTH**
  - Using immediate-release medicines
  - Child 10–17 years: 200 mg once daily (max. per dose 200 mg 3 times a day), adjusted according to response

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Gall bladder disease, hypoalbuminaemia, nephrotic syndrome, photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment

- **INTERACTIONS** → Appendix 1: fibrates

- **SIDE-EFFECTS**
  - Common or very common Abdominal distension, anorexia, diarrhoea, nausea
  - Uncommon Alopecia, cholestasis, dizziness, erectile dysfunction, headache, myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment, photosensitivity reactions, pruritus, rash, renal failure, urticaria
Fenofibrate

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

Hyperlipidaemias including familial hypercholesterolaemia (administered on expert advice)

- **By mouth using capsules**
  - Child 4-14 years: One 67 mg (micronised) capsule per 20 kg body-weight daily, maximum four 67 mg capsules daily, or max. three 67 mg capsules daily with concomitant statin
  - Child 15-17 years: Initially 3 capsules daily, then increased if necessary to 4 capsules daily, max. 3 capsules daily with concomitant statin, dose relates to 67 mg (micronised) capsules

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises max. dose 200 mg daily with concurrent use of a statin—no specific recommendation made for children.

**UNLICENSED USE** 200 mg and 267 mg capsules not licensed in children.

**CONTRA-INDICATIONS** Gall bladder disease - pancreatitis (unless due to severe hypertriglyceridaemia) - photosensitivity to ketoprofen

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** Appendix 1: fibrates

**SIDE-EFFECTS**

- **Common or very common** Abdominal distension - anorexia - diarrhoea - nausea
- **Uncommon** Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—significant risk in renal impairment - pancreatitis - photosensitivity reactions - pruritus - pulmonary embolism - rash - renal failure - urticaria
- **Rare** Hepatitis - peripheral neuropathy
- **Very rare** Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancytopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

**PREGNANCY** Avoid—embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Manufacturer advises max. 67 mg daily if estimated glomerular filtration rate 30–59 mL/minute/1.73 m². Manufacturer advises use with caution in mild-to-moderate impairment; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**INTERACTIONS**

- **STATINS**

  - Concomitant statin

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 21
  - Bezafibrate (Non-proprietary)
    - Bezafibrate 200 mg Bezafibrate 200mg tablets | 100 tablet
      - £8.50 DT price = £4.36
    - Bezalip (Teva UK Ltd)
      - Bezafibrate 200 mg Bezalip 200mg tablets | 100 tablet
        - £8.63 DT price = £4.36

**LIPID MODIFYING DRUGS > STATINS**

Statins

**DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
CAUTIONS  High alcohol intake · history of liver disease · hypothyroidism · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

CAUTIONS, FURTHER INFORMATION
- Muscle effects  Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.
- Hypothyroidism  Hypothyroidism should be managed adequately before starting treatment with a statin.

SIDE-EFFECTS
- Rare  Hepatitis · jaundice
- Very rare  Haemorrhagic stroke · interstitial lung disease · lupus erythematosus-like reactions · pancreatitis
- Frequency not known  Alopecia · altered liver function tests · amnesia · arthralgia · asthenia · depression · dizziness · fatigue · gastro-intestinal disturbances · headache · hyperglycaemia · hypersensitivity reactions · may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition) · myalgia · myopathy · myositis · paraesthesia · peripheral neuropathy · pruritus · rash · rhabdomyolysis · sexual dysfunction · sleep disturbance · thrombocytopenia · urticaria · visual disturbance

SIDE-EFFECTS, FURTHER INFORMATION
- Muscle effects  The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses. If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.
- Interstitial lung disease  If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

CONCEPTION AND CONTRACEPTION  Adequate contraception is required during treatment and for 1 month afterwards.

PREGNANCY  Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

HEPATIC IMPAIRMENT  Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

MONITORING REQUIREMENTS
- Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.
- Liver function  There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease). Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.
- Creatine kinase  Creatine kinase concentration should be measured in children before treatment and if unexplained muscle pain occurs.

PATIENT AND CARER ADVICE  Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

07-Jun-2017

INDICATIONS AND DOSE

Hyperlipidaemia including familial hypercholesterolaemia  → BY MOUTH  → Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be adjusted at intervals of at least 4 weeks

Homogygous familial hypercholesterolaemia  → BY MOUTH  → Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 80 mg once daily, dose to be adjusted at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.

CAUTIONS  Haemorrhagic stroke

INTERACTIONS  → Appendix 1: statins
PATIENT AND CARER ADVICE

Patient counselling is advised for atorvastatin tablets (muscle effects).

Medicines for Children leaflet: Atorvastatin for high cholesterol

www.medicinesforchildren.org.uk/atorvastatin-high-cholesterol-0

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- Fluvastatin (Non-proprietary)
- Fluvastatin (as Fluvastatin sodium) 80 mg
- Fluvastatin 80 mg modified-release tablets | 28 tablet | £19.20 DT price = £19.20
- Dorisin XL (Aspire Pharma Ltd)
- Fluvastatin (as Fluvastatin sodium) 80 mg
- Dorisin XL 80 mg tablets | 28 tablet | £19.20 DT price = £19.20
- Lescal XL (Novartis Pharmaceuticals UK Ltd)
- Fluvastatin (as Fluvastatin sodium) 80 mg
- Lescal XL 80 mg tablets | 28 tablet | £19.20 DT price = £19.20
- Luvinsila XL (Actavis UK Ltd)
- Fluvastatin (as Fluvastatin sodium) 80 mg
- Luvinsila XL 80 mg tablets | 28 tablet | £19.20 DT price = £19.20

- Lescal 40 mg capsules | 28 capsule | £15.26 DT price = £2.30

Pravastatin sodium

INDICATIONS AND DOSE

Hyperlipidaemia including familial hypercholesterolaemia

- BY MOUTH

Child 8-13 years: 10 mg daily, then increased if necessary up to 20 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Child 14-17 years: 10 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises initial dose 20 mg daily with concurrent use of ciclosporin, increasing with caution to 40 mg daily—no specific recommendation made for children.

INTERACTIONS → Appendix 1: statins

SIDE-EFFECTS

- Uncommon: Abnormal urination • dysuria • nocturia • urinary frequency
- Very rare: Fulminant hepatic necrosis
- BREAST FEEDING: Manufacturer advises avoid—small amount of drug present in breast milk.
- REPRODUCTIVE IMPAIRMENT: Start with lower doses in moderate to severe impairment.
- PATIENT AND CARER ADVICE: Patient counselling is advised for pravastatin tablets (muscle effects).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pravastatin sodium (Non-proprietary)

- Pravastatin sodium 10 mg
- Pravastatin 10 mg tablets | 28 tablet | £16.10 DT price = £0.87
- Pravastatin sodium 20 mg
- Pravastatin 20 mg tablets | 28 tablet | £29.60 DT price = £1.04
- Pravastatin sodium 40 mg
- Pravastatin 40 mg tablets | 28 tablet | £29.60 DT price = £1.26

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Atorvastatin (Non-proprietary)
- Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg
- Atorvastatin 10 mg tablets | 28 tablet | £13.00 DT price = £0.88
- Atorvastatin (as Atorvastatin calcium trihydrate) 20 mg
- Atorvastatin 20 mg tablets | 28 tablet | £24.64 DT price = £1.02
- Atorvastatin (as Atorvastatin calcium trihydrate) 30 mg
- Atorvastatin 30 mg tablets | 28 tablet | £25.35 DT price = £25.35
- Atorvastatin (as Atorvastatin calcium trihydrate) 40 mg
- Atorvastatin 40 mg tablets | 28 tablet | £24.64 DT price = £1.19
- Atorvastatin (as Atorvastatin calcium trihydrate) 60 mg
- Atorvastatin 60 mg tablets | 28 tablet | £28.97 DT price = £28.97
- Atorvastatin (as Atorvastatin calcium trihydrate) 80 mg
- Atorvastatin 80 mg tablets | 28 tablet | £28.21 DT price = £1.89

Chewable tablet

- Lipitor (Pfizer Ltd)
- Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg
- Lipitor 10 mg chewable tablets | 30 tablet | £13.80 DT price = £13.80

- Lipitor 20 mg chewable tablets | 30 tablet | £26.40 DT price = £26.40

Fluvastatin

INDICATIONS AND DOSE

Heterozygous familial hypercholesterolaemia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 9–17 years: Initially 20 mg daily, dose to be taken in the evening, then (by mouth) adjusted in steps of 20 mg daily (max. per dose 40 mg twice daily), adjusted at intervals of at least 6 weeks; maximum 80 mg per day

- BY MOUTH USING MODIFIED-RELEASE MEDICINES

Child 9–17 years: 80 mg daily, dose form is not appropriate for initial dose titration

INTERACTIONS → Appendix 1: statins

SIDE-EFFECTS

- Very rare: Vasculitis

BREAST FEEDING: Manufacturer advises avoid—no information available.

REPRODUCTIVE IMPAIRMENT: Manufacturer advises doses above 40 mg daily should be initiated with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE: Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).
Rosuvastatin

- **INDICATIONS AND DOSE**
  - **Hyperlipidaemia including familial hypercholesterolaemia**
    - **BY MOUTH**
    - Child 10-17 years: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity)

- **SIDE-EFFECTS**
  - Rare: Anaemia
  - Frequency not known: Tendinopathy

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
  - Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for rosuvastatin tablets (muscle effects).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  - Crestor (AstraZeneca UK Ltd)
    - Rosuvastatin (as Rosuvastatin calcium) 5 mg Crestor 5mg tablets | 28 tablet (POs) £18.03 DT price = £18.03
    - Rosuvastatin (as Rosuvastatin calcium) 10 mg Crestor 10mg tablets | 28 tablet (POs) £18.03 DT price = £18.03
    - Rosuvastatin (as Rosuvastatin calcium) 20 mg Crestor 20mg tablets | 28 tablet (POs) £26.02 DT price = £26.02
    - Rosuvastatin (as Rosuvastatin calcium) 40 mg Crestor 40mg tablets | 28 tablet (POs) £29.69 DT price = £29.69

Simvastatin

- **INDICATIONS AND DOSE**
  - **Hyperlipidaemia including familial hypercholesterolaemia**
    - **BY MOUTH**
    - Child 5-9 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks
    - Child 10-17 years: Initially 10 mg once daily, then increased if necessary up to 40 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. dose 10 mg daily with concurrent use of bezafibrate—no specific recommendation made for children.
  - Manufacturer advises max. dose 20 mg daily with concurrent use of amiodarone or amlopidine—no specific recommendation made for children.
  - Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem)—no specific recommendation made for children.

- **UNLICENSED USE**
  - Not licensed for use in children under 10 years.

- **INTERACTIONS**
  - Appendix 1: statins

Simvastatin with ezetimibe

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin above, ezetimibe p. 126.

- **INDICATIONS AND DOSE**
  - Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone
    - **BY MOUTH**
    - Child (initiated by a specialist): (consult product literature)

- **INTERACTIONS**
  - Appendix 1: ezetimibe, statins

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Inegy (Merck Sharp & Dohme Ltd)
    - Ezetimibe 10 mg, Simvastatin 20 mg | Inegy 10mg/20mg tablets | 28 tablet (POs) £33.42 DT price = £33.42
Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

### INDICATIONS AND DOSE

**Homozygous familial hypercholesterolaemia (in combination with other lipid-lowering therapies)**
- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm

**Homzygous familial hypercholesterolaemia in patients on apheresis (In combination with other lipid-lowering therapies)**
- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

### INTERACTIONS
- Appendix 1: monoclonal antibodies

### SIDE-EFFECTS
- **Common or very common** Arthralgia · back pain · influenza · nasopharyngitis · nausea · rash · upper respiratory tract infection
- **Uncommon** Urticaria
- **PREGNANCY** Manufacturer advises consider avoiding use unless necessary.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor in moderate impairment—possible reduced efficacy; use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—no information available.
- **HANDLING AND STORAGE** Manufacturer advises avoid storing in areas where there is a possibility of fire, water, or electricity, or other means of sudden temperature changes.
- **PATIENT AND CARER ADVICE** Patients and their carers should be given training in subcutaneous injection technique.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- **Evolocumab (Amgen Ltd)**
  - **Repatha 140 mg per 1ml**
  - Repatha 140mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £170.00
  - **Repatha SureClick (Amgen Ltd)**
  - Repatha SureClick 140mg/1ml solution for injection pre-filled disposable devices | 2 pre-filled disposable injection £340.20

### Nitrates

#### Overview
Nitrates are potent coronary vasodilators, but their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially if the child is unusually sensitive to the effects of nitrates or is hypovolaemic. Glyceryl trinitrate p. 132 is also used in extravasation.

#### CONTRA-INDICATIONS
- Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

#### CAUTIONS
- Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

#### CAUTIONS, FURTHER INFORMATION
- **Tolerance** Children receiving nitrates continuously throughout the day can develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients.

#### SIDE-EFFECTS
- **COMMON SIDE-EFFECTS**
  - **Dizziness** · postural hypotension · tachycardia · throbbing headache
  - **Uncommon** Flushing · heartburn · nausea · rash · syncope · temporary hypoxaemia · vomiting
  - **Very rare** Angle-closure glaucoma
  - **Frequency not known** Paroxysmal bradycardia

#### SPECIFIC SIDE-EFFECTS
- With intravenous use Abdominal pain · apprehension · diaphoresis · muscle twitching · palpitation · prolonged administration has been associated with methaemoglobinemia · restless · retrosternal discomfort · severe hypotension

#### SIDE-EFFECTS, FURTHER INFORMATION
- With intravenous use Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, diaphoresis, apprehension, restless, muscle twitching, retrosternal discomfort, palpitation, abdominal pain; prolonged administration has been associated with methaemoglobinemia.

#### ALLERGY AND CROSS-SENSITIVITY
- Contra—indicated in nitrate hypersensitivity.

#### BREAST FEEDING
- No information available—manufacturers advise use only if potential benefit outweighs risk.

#### HEPATIC IMPAIRMENT
- Caution in severe impairment.

#### RENAL IMPAIRMENT
- Manufacturers advise use with caution in severe impairment.

#### MONITORING REQUIREMENTS
- Monitor blood pressure and heart rate during intravenous infusion.

#### TREATMENT CESSION
- Avoid abrupt withdrawal.
Glyceryl trinitrate

- **INDICATIONS AND DOSE**
  - **Neonate**: 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute).
  - **Child**: Initially 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute); maximum 200 micrograms/minute.

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS**
- **PREGNANCY** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).
  - Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - Glyceryl trinitrate 1 mg per 1 ml Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial £15.90 | 25 vial £16.90 price available.
    - Glyceryl trinitrate 5 mg per 1 ml Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule £64.90.
    - Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule £32.45
  - **Nitrocin (Aspire Pharma Ltd)**
    - Glyceryl trinitrate 1 mg per 1 ml Nitrocin 10mg/10ml solution for infusion ampoules | 10 ampoule £58.75 (Hospital only).
  - **Nitrolan (Merck Serono Ltd)**
    - Glyceryl trinitrate 1 mg per 1 ml Nitrolan 5mg/5ml solution for infusion ampoules | 10 ampoule £18.04
    - Nitrolan 50mg/50ml solution for infusion vials | 1 vial £14.76

Paediatric advanced life support
Cardiopulmonary (cardiac) arrest in children is rare and frequently represents the terminal event of progressive shock or respiratory failure.

During cardiopulmonary arrest in children without intravenous access, the intraosseous route is chosen because it provides rapid and effective response; if circulatory access cannot be gained, the endotracheal tube can be used. When the endotracheal route is used ten times the intravenous dose should be used; the drug should be injected quickly down a narrow bore suction catheter beyond the tracheal end of the tube and then flushed in with 1 or 2 mL of sodium chloride 0.9%. The endotracheal route is useful for lipid-soluble drugs, including lidocaine hydrochloride p. 74, adrenaline/epinephrine below, atropine sulfate p. 779, and naloxone hydrochloride p. 813. Drugs that are not lipid-soluble (e.g. sodium bicarbonate p. 558 and calcium chloride p. 567) should not be administered by this route because they will injure the airways.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 165.

**SYMPATHOMIMETICS**

Adrenaline/epinephrine

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₂ effects); it can cause peripheral vasodilation (a beta₁ effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**
  - **Acute hypotension**
    - By continuous intravenous infusion
    - Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
    - Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension
  - **Croup (when not effectively controlled with corticosteroid treatment)**
    - By inhalation of nebulised solution
    - Child 1 month–11 years: 400 micrograms/kg (max. per dose 5 mg), dose to be repeated after 30 minutes if necessary
  - **PHARMACOKINETICS**
    - The effects of nebulised adrenaline for the treatment of croup lasts for 2–3 hours.
  - **Emergency treatment of acute anaphylaxis (under expert supervision)**
    - By intramuscular injection
    - Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh;
    - Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh;
    - Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times

7.1 Cardiac arrest

**Cardiopulmonary resuscitation**

**Overview**
The algorithms for cardiopulmonary resuscitation (Life support algorithm (image) p. 1062) reflect the recommendations of the Resuscitation Council (UK); they cover paediatric basic life support, paediatric advanced life support, and newborn life support. The guidelines are available at www.resus.org.uk.
if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal.

**Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only)** / Angioedema (if laryngeal oedema is present) (specialist use only)

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 1 microgram/kg (max. per dose 50 micrograms), using dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained.

- **EMERADE® 150 MICROGRAMS**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight up to 15 kg): 150 micrograms after 5–15 minutes as required
      - Child (body-weight 15–30 kg): 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

- **EMERADE® 300 MICROGRAMS**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

- **EMERADE® 500 MICROGRAMS**
  - Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)
    - **BY INTRAMUSCULAR INJECTION**
      - Child 12-17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required

- **EPIPEN® AUTO-INJECTOR 0.3MG**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

- **EPIPEN® JR AUTO-INJECTOR 0.15MG**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
      - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

- **JEXT® 150 MICROGRAMS**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
      - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required

- **JEXT® 300 MICROGRAMS**
  - Acute anaphylaxis (for self-administration)
    - **BY INTRAMUSCULAR INJECTION**
      - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

- **With intravenous use for acute hypotension** Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

### IMPORTANT SAFETY INFORMATION

#### SAFE PRACTICE

Intravenous route should be used with **extreme care** by specialists only.

- **CAUTIONS** Arrhythmias, cerebrovascular disease - cor pulmonale - diabetes mellitus - hypercalcaemia - hyperreflexia - hypertension - hyperthyroidism - hypokalaemia - ischaemic heart disease - obstructive cardiomyopathy - occlusive vascular disease - organic brain damage - phaeochromocytoma - prostate disorders - psychoneurosis - severe angina - susceptibility to angle-closure glaucoma

#### FURTHER INFORMATION

Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Angina - angle-closure glaucoma - anorexia - anxiety - arrhythmias - cold extremities - confusion - difficulty in micturition - dizziness - dry mouth - dyspnoea - headache - hyperglycaemia - hypersalivation - hypertension (risk of cerebral haemorrhage) - hypokalaemia - insomnia - metabolic acidosis - mydriasis - myocardial infarction - nausea - pallor - palpitation - psychosis - pulmonary oedema (on excessive dosage or extreme sensitivity) - restlessness - sweating - tachycardia - tissue necrosis at injection site - tissue necrosis of bowel - tissue necrosis of extremities - tissue necrosis of kidneys - tissue necrosis of liver - tremor - urinary retention - vomiting - weakness

- **PREGNANCY** May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

- **BREAST FEEDING** Present in milk but unlikely to be harmful as poor oral bioavailability.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use for acute hypotension For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.
  - When used by inhalation For nebulisation in croup, adrenaline 1 in 1000 solution may be diluted with sterile sodium chloride 0.9% solution.

- **PRESCRIBING AND DISPENSING INFORMATION** It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

  Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength.

  Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

### UNLICENSED USE

- With intramuscular use for acute anaphylaxis Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every injection of adrenaline-auto-injector-anaphylaxis-emergency treatment of anaphylaxis.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

**PATIENT AND CARER ADVICE**

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance when and how to inject it.

**JEXT® 300 MICROGRAMS** 1.1 mL of the solution remains in the auto-injector device after use.

**JEXT® 150 MICROGRAMS** 1.25 mL of the solution remains in the auto-injector device after use.

**EPIPEN® JR AUTO-INJECTOR 0.15MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE® 300 MICROGRAMS** 0.2 mL of the solution remains in the auto-injector device after use.

**EPIPEN® AUTO-INJECTOR 0.3MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE® 500 MICROGRAMS** No solution remains in the auto-injector device after use.

**EMERADE® 150 MICROGRAMS** 0.35 mL of the solution remains in the auto-injector device after use. Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-auto-injector-anaphylaxis-0

**EXCEPTIONS TO LEGAL CATEGORY** POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

EXCPIENTS: May contain Sulphites

- Adrenaline/epinephrine (Non-proprietary)
  - Adrenaline 100 microgram per 1 mL Adrenaline (base) 100 micrograms/1mL (1 in 10,000) dilute solution for injection ampoules | 10 ampoule £63.09
  - Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection £6.87 | 1 pre-filled disposable injection (Hospital only) | 10 pre-filled disposable injection £18.00 (Hospital only)
  - Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 mL Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 1 ampoule £43.53 | 10 ampoule £73.13
  - Adrenaline (base) 500micrograms/5ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule £67.22

**Adrenaline 1 mg per 1 ml** Adrenaline (base) 10mg/10ml (1 in 1000) solution for injection ampoules | 10 ampoule £79.65

**Adrenaline (base) for anaphylaxis 1mg/1ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-filled disposable injection £10.40

**Adrenaline (base) 1mg/1ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-filled disposable injection £10.40

**Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml**

- Adrenaline (base) 5mg/5ml (1 in 10,000) solution for injection ampoules | 10 ampoule £77.54
- Adrenaline (base) 500micrograms/0.5ml (1 in 1000) solution for injection ampoules | 10 ampoule £59.87-£61.33 DT price = £53.87
- Adrenaline (base) 1mg/1ml (1 in 1000) solution for injection ampoules | 10 ampoule £60.01 DT price = £60.01

- **Emerade** (Bausch & Lomb UK Ltd)
  - Adrenaline 1 mg per 1 ml Emerade 300micrograms/0.3ml (1 in 1000) solution for injection auto-injectors | 1 pre-filled disposable injection £25.99 DT price = £26.45
  - **Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml** Emerade 300micrograms/0.15ml (1 in 1000) solution for injection auto-injectors | 1 pre-filled disposable injection £25.99

- **Emerade 500microgram per 1 ml** Emerade Jr 150micrograms/0.3ml (1 in 2000) solution for injection auto-injectors | 1 pre-filled disposable injection £26.45 | 2 pre-filled disposable injection £52.90

- **EPIPEN (Meda Pharmaceuticals Ltd)**
  - Adrenaline 500 microgram per 1 mL EpiPen Jr. 150micrograms/0.3ml (1 in 2000) solution for injection auto-injectors | 1 pre-filled disposable injection £26.45 | 2 pre-filled disposable injection £52.90

- **Jext (ALK-Abello Ltd)**
  - Adrenaline 1 mg per 1 ml Jext 300micrograms/0.3ml (1 in 1000) solution for injection auto-injectors | 1 pre-filled disposable injection £22.99 DT price = £26.45

- **Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml** Jext 150micrograms/0.15ml (1 in 1000) solution for injection auto-injectors | 1 pre-filled disposable injection £23.99

---

**8 Oedema**

**Diuretics**

**Overview**

Diuretics are used for a variety of conditions in children including pulmonary oedema (caused by conditions such as respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and hypertension. Hypertension in children is often resistant to therapy and may require the use of several drugs in combination. Maintenance of fluid and electrolyte balance can be difficult in children on diuretics, particularly neonates whose renal function may be immature.

Loop diuretics are used for pulmonary oedema, congestive heart failure, and in renal disease.

Thiazides are used less commonly than loop diuretics but are often used in combination with loop diuretics or spironolactone p. 123 in the management of pulmonary oedema and, in lower doses, for hypertension associated with cardiac disease.

Aminophylline infusion p. 161; has been used with intravenous furosemide p. 136 to relieve fluid overload in critically ill children.

**Heart failure**

Heart failure is less common in children than in adults; it can occur as a result of congenital heart disease (e.g. septal defects), dilated cardiomyopathy, myocarditis, or cardiac surgery. Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function has not been established.
Acute heart failure can occur after cardiac surgery or as a complication in severe acute infections with or without myocarditis. Therapy consists of volume loading, vasodilator or inotropic drugs.

Chronic heart failure is initially treated with a loop diuretic, usually furosemide supplemented with spironolactone, amiloride hydrochloride p. 138, or potassium chloride p. 575. If diuresis with furosemide is insufficient, the addition of metolazone p. 138 or a thiazide diuretic can be considered. With metolazone the resulting diuresis can be profound and care is needed to avoid potentially dangerous electrolyte disturbance.

If diuretics are insufficient an ACE inhibitor, titrated to the maximum tolerated dose, can be used. ACE inhibitors are used for the treatment of all grades of heart failure in adults and can also be useful for children with heart failure. Addition of digoxin p. 79 can be considered in children who remain symptomatic despite treatment with a diuretic and an ACE inhibitor.

Some beta-blockers improve outcome in adults with heart failure, but data on beta-blockers in children are limited. Carvedilol p. 122 has vasodilator properties and therefore (like ACE inhibitors) also lowers afterload.

In children receiving specialist cardiology care, the phosphodiesterase type-3 inhibitor enoximone p. 123 is sometimes used by mouth for its inotropic and vasodilator effects. Spironolactone is usually used as a potassium-sparing drug with a loop diuretic; in adults low doses of spironolactone are effective in the treatment of heart failure. Careful monitoring of serum potassium is necessary if spironolactone is used in combination with an ACE inhibitor.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 107 is licensed for use in children; chlorothiazide p. 108 is also used.

Chlortalidone p. 138, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days in younger children.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure) and is most effective when given 30–60 minutes before furosemide profound diuresis can occur and the child should therefore be monitored carefully.

Loop diuretics

Loop diuretics inhibit reabsorption of sodium, potassium, and chloride from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

Furosemide and bumetanide p. 136 are similar in activity; they produce dose-related diuresis. Furosemide is used extensively in children. It can be used for pulmonary oedema (e.g. in respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and in renal disease.

Potassium-sparing diuretics and aldosterone antagonists

Spironolactone is the most commonly used potassium-sparing diuretic in children; it is an aldosterone antagonist and enhances potassium retention and sodium excretion in the distal tubule. Spironolactone is combined with other diuretics to reduce urinary potassium loss. It is also used in nephrotic syndrome, the long-term management of Bartter’s syndrome, and high doses can help to control ascites in babies with chronic neonatal hepatitis. The clinical value of spironolactone in the management of pulmonary oedema in preterm neonates with chronic lung disease is uncertain.

Potassium canrenone p. 122 given intravenously, is an alternative aldosterone antagonist that may be useful if a potassium-sparing diuretic is required and the child is unable to take oral medication. It is metabolised to canrenone, which is also a metabolite of spironolactone.

Amiloride hydrochloride on its own is a weak diuretic. It causes retention of potassium and is therefore given with thiazide or loop diuretics as an alternative to giving potassium supplements.

A potassium-sparing diuretic such as spironolactone or amiloride hydrochloride may also be used in the management of amphotericin-induced hypokalaemia.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a child receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe diuretics separately in children, the use of fixed combinations may be justified in older children if compliance is a problem. (Some preparations may not be licensed for use in children—consult product literature).

Other diuretics

Mannitol p. 137 is used to treat cerebral oedema, raised intraocular pressure, peripheral oedema, and acites.

The carbonic anhydrase inhibitor acetazolamide p. 655 is a weak diuretic although it is little used for its diuretic effect. Acetazolamide and eye drops of dorzolamide p. 656 and brinzolamide p. 656 inhibit the formation of aqueous humour and are used in glaucoma. Acetazolamide is also used in the treatment of epilepsy, and raised intracranial pressure.

Diuretics with potassium

Diuretics and potassium supplements should be prescribed separately.

DIURETICS ▶ LOOP DIURETICS

Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

- **CONTRA-INDICATIONS** Anuria - renal failure due to nephrotic or hepatoxic drugs - severe hypokalaemia - severe hypernatremia

- **CAUTIONS** Can cause acute urinary retention in children with obstruction of urinary outflow - can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) - can exacerbate gout - comatose and precomatose states associated with liver cirrhosis - hypotension should be corrected before initiation of treatment - hypovolaemia should be corrected before initiation of treatment

**CAUTIONS, FURTHER INFORMATION**

- **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a
loop diuretic.

Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy.

The use of potassium-sparking diuretics avoids the need to take potassium supplements.

- Urinary retention  Loop diuretics can cause acute urinary retention in children with obstruction of urinary outflow, therefore adequate urinary output should be established before initiating treatment.

- SIDE-EFFECTS
  - Very rare
    - Hyperuricaemia
  - Frequency not known
    - Acute urinary retention - blood disorders - bone-marrow depression - deafness (usually with high doses and rapid intravenous administration, and in renal impairment) - electrolyte disturbances - hepatic encephalopathy - hyperglycaemia (less common than with thiazides) - hypersensitivity reactions - hypochloremia - hypokalaemia - hypomagnesaemia - hyponatraemia - increased calcium excretion (nephrocalcinosis and nephrolithiasis reported with long-term use of furosemide in preterm infants) - leucopenia - metabolic alkalosis - mild gastro-intestinal disturbances - pancreatitis - photosensitivity - postural hypotension - rash - temporary increase in serum-cholesterol and triglyceride concentration - thrombocytopenia - tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) - visual disturbances

- HEPATIC IMPAIRMENT
  - Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparking diuretics can be used to prevent this.

- RENAL IMPAIRMENT
  - High doses of loop diuretics may occasionally be needed in renal impairment. High doses or rapid intravenous administration can cause tinnitus and deafness.

- MONITORING REQUIREMENTS

### Bumetanide

#### INDICATIONS AND DOSE

**Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema**

- **BY MOUTH**
  - Child 1 month–11 years: 0.5–2 mg/kg every 12–24 hours, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
  - Child 12–17 years: 20–40 mg daily; increased to 80–120 mg daily, in resistant oedema

- **BY SLOW INTRAVENOUS INJECTION**
  - Neonate: 0.5–1 mg/kg every 12–24 hours, alternatively 0.5–1 mg/kg every 24 hours, if corrected gestational age under 31 weeks.

**Oedema in heart failure, renal disease, and hepatic disease following cardiac surgery | Pulmonary oedema following cardiac surgery**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: Initially 100 micrograms/kg/hour, dose to be doubled every 2 hours until urine output exceeds 1 mL/kg/hour

**Oliguria**

- **BY MOUTH**
  - Child 12–17 years: Initially 250 mg daily, then increased in steps of 250 mg every 4–6 hours (max. per dose 2 g) if required

- **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 2–5 mg/kg up to 4 times a day; maximum 1 g per day
  - Child 12–17 years: Initially 250 mg, dose to be administered over 1 hour, increased to 500 mg, increased dose is given if satisfactory urine output not obtained; dose administered over 2 hours, then increased to 1 g, increased dose given if satisfactory response not obtained within subsequent hour; dose to be administered over 4 hours. If no response obtained, diuresis probably required; effective dose of up to 1 g given at a maximum rate of 4 mg/minute can be repeated every 24 hours

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Bumetanide (Non-proprietary)**
  - Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml POM £198.00 DT price = £198.00

- **Tablet**
  - Bumetanide (Non-proprietary)
    - Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet POM £7.35 DT price = £1.64
    - Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet POM £7.00 DT price = £6.98

### Furosemide

**Furosemide**

#### INDICATIONS AND DOSE

**Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema**

- **BY MOUTH**
  - Neonate: 0.5–2 mg/kg every 12–24 hours, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age under 31 weeks.

- **Child 1 month–11 years**
  - 0.5–2 mg/kg 2–3 times a day, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age of under 31 weeks, higher doses may be required in resistant oedema; maximum 80 mg per day; maximum 12 mg/kg per day
  - Child 12–17 years: 20–40 mg daily; increased to 80–120 mg daily, in resistant oedema

- **BY SLOW INTRAVENOUS INJECTION**
  - Neonate: 0.5–1 mg/kg every 12–24 hours, alternatively 0.5–1 mg/kg every 24 hours, if corrected gestational age under 31 weeks.

- **Child 1 month–11 years**
  - 0.5–1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours) as required; maximum 6 mg/kg per day
  - Child 12–17 years: 20–40 mg every 8 hours as required, higher doses may be required in resistant cases

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: 0.1–2 mg/kg/hour

**Oedema in heart failure, renal disease, and hepatic disease following cardiac surgery | Pulmonary oedema following cardiac surgery**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: Initially 100 micrograms/kg/hour, dose to be doubled every 2 hours until urine output exceeds 1 mL/kg/hour

**Oliguria**

- **BY MOUTH**
  - Child 12–17 years: Initially 250 mg daily, then increased in steps of 250 mg every 4–6 hours (max. per dose 2 g) if required

- **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 2–5 mg/kg up to 4 times a day; maximum 1 g per day
  - Child 12–17 years: Initially 250 mg, dose to be administered over 1 hour, increased to 500 mg, increased dose is given if satisfactory urine output not obtained; dose administered over 2 hours, then increased to 1 g, increased dose given if satisfactory response not obtained within subsequent hour; dose to be administered over 4 hours. If no response obtained, diuresis probably required; effective dose of up to 1 g given at a maximum rate of 4 mg/minute can be repeated every 24 hours
**DIURETICS > OSMOTIC DIURETICS**

### Mannitol

**INDICATIONS AND DOSE**

**Cerebral oedema**
- **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 0.25–1.5 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
  - Child 12–17 years: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

**Peripheral oedema and ascites**
- **BY INTRAVENOUS INFUSION**
  - Child: 1–2 g/kg, to be given over 2–6 hours

**UNLICENSED USE** Not licensed for use in children under 12 years.

**CONTRA-INDICATIONS** Anuria; intracranial bleeding (except during craniotomy); severe cardiac failure; severe dehydration; severe pulmonary oedema

**CAUTIONS** Extravasation causes inflammation and thrombophlebitis

**SIDE-EFFECTS**
- Uncommon Electrolyte imbalance; fluid imbalance; hypotension; thrombophlebitis
- Rare Anaphylaxis; arhythmia; blurred vision; chest pain; chills; convulsions; cramp; dehydration; dizziness; dry mouth; fever; focal osmotic nephrosis; headache; hypersensitivity reactions; hypertension; nausea; oedema; pulmonary oedema; raised intracranial pressure; rhinitis; skin necrosis; thirst; urinary retention; urticaria; vomiting
- Very rare Acute renal failure; congestive heart failure

**PREGNANCY** Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

**RENAL IMPAIRMENT** Use with caution in severe impairment.

**PRE-TREATMENT SCREENING** Assess cardiac function before treatment.

**MONITORING REQUIREMENTS** Monitor fluid and electrolyte balance, serum osmolality, and cardiac, pulmonary and renal function.

**DIRECTIONS FOR ADMINISTRATION** Examine infusion for crystals. If crystals present, dissolve by warming infusion fluid (allow to cool to body temperature before administration).

For mannitol 20%, an in-line filter is recommended (15-micron filters have been used).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for injection**

- **Furosemide (Non-proprietary)**
  - Furosemide 20 mg/5ml oral solution
    - 150 ml [POM] £18.69
  - Furosemide 40 mg/5ml oral solution
    - 500 ml [POM] £24.95

- **Mannitol**
  - Mannitol 200 mg/5ml (10%) infusion Viaflo bags
    - 1 bag [POM] no price available
  - Mannitol 500 mg/5ml (10%) infusion Viaflo bags
    - 1 bag [POM] no price available

**Infusion**

- **Mannitol (Non-proprietary)**
  - Mannitol 50g/500ml (10%) infusion Viaflex bags
    - 1 bag [POM] no price available
  - Mannitol 50g/500ml (10%) infusion Viaflo bags
    - 20 bag [POM] no price available

- **Poly fusor K bag**
  - 500 ml [POM] no price available

- **Poly fusor K 500 ml**
  - 1 bag [POM] no price available

**Oral solution**

- **Furosemide (Non-proprietary)**
  - Furosemide 4 mg/5ml oral solution
    - 150 ml [POM] £15.58
  - Furosemide 8 mg/5ml oral solution
    - 150 ml [POM] £22.60

DIURETICS > POTASSIUM-SPARING DIURETICS

Amiloride hydrochloride

**INDICATIONS AND DOSE**

- **Adjunct to thiazide or loop diuretics for oedema in heart failure, and hepatic disease (where potassium conservation desirable)**
  - **BY MOUTH**
    - Neonate: 100–200 micrograms/kg twice daily.
    - Child 1 month–11 years: 100–200 micrograms/kg twice daily; maximum 20 mg per day.
    - Child 12-17 years: 5–10 mg twice daily

**UNLICENSED USE**

- Not licensed for use in children.

**CONTRA-INDICATIONS**

- Addison’s disease
- Anuria
- Hyperkalaemia

**CAUTIONS**

- Diabetes mellitus

**INTERACTIONS**

→ Appendix 1: potassium-sparing diuretics

**SIDE-EFFECTS**

- Abdominal pain, agitation, alopecia, angina, anorexia, arrhythmias, arthralgia, confusion, constipation, cough, diarrhoea, dizziness, dry mouth, dyspepsia, dyspnoea, encephalopathy, flatulence, gastrointestinal bleeding, headache, hyperkalaemia, insomnia, jaundice, malaise, muscle cramp, nasal congestion, nausea, palpitation, paraesthesia, postural hypotension, pruritus, raised intra-ocular pressure, rash, sexual dysfunction, thirst, tinnitus, tremor, urinary disturbances, visual disturbance, vomiting, weakness

**PREGNANCY**

- Not to be used to treat gestational hypertension.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

- Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**

- Monitor electrolytes.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral solution**

**EXCIPIENTS:** May contain Propylene glycol

- Amiloride hydrochloride 1 mg per 1 ml Amiloride 5mg/5ml oral solution sugar free sugar-free | 150 ml (POM) no price available DT price = £37.35
- Amilamont (Rosemont Pharmaceuticals Ltd)
  - Amiloride hydrochloride 1 mg per 1 ml Amilamont 5mg/5ml oral solution sugar free sugar-free | 150 ml (POM) £37.35 DT price = £37.35

**Tablet**

- Amiloride hydrochloride (Non-proprietary)
  - Amiloride hydrochloride 5 mg Amiloride 5mg tablets | 28 tablet (POM) £1.21 DT price = £1.21

**DIURETICS > THIAZIDES AND RELATED DIURETICS**

Chlortalidone

*(Chlortalidone)*

**INDICATIONS AND DOSE**

- **Ascites** Oedema in nephrotic syndrome
  - **BY MOUTH**
    - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
    - Child 12-17 years: Up to 50 mg daily

- **Hypertension**
  - **BY MOUTH**
    - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
    - Child 12-17 years: 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

- **Stable heart failure**
  - **BY MOUTH**
    - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
    - Child 12-17 years: 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance

**INTERACTIONS**

→ Appendix 1: thiazide diuretics

**SIDE-EFFECTS**

- Rare
- Jaundice

**BREAST FEEDING**

- The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Chlortalidone (Non-proprietary)
  - Chlortalidone 25 mg Chlortalidone 25mg tablets | 100 tablet (POM) no price available
  - Chlortalidone 50 mg Chlortalidone 50mg tablets | 30 tablet (POM) £90.55 DT price = £90.20

Metolazone

**INDICATIONS AND DOSE**

- **Oedema resistant to loop diuretics in heart failure, renal disease and hepatic disease** Pulmonary oedema
- **Adjunct to loop diuretics to induce diuresis**
  - **BY MOUTH**
    - Child 1 month–11 years: 100–200 micrograms/kg 1–2 times a day
    - Child 12-17 years: 5–10 mg once daily, dose to be taken in the morning; increased if necessary to 5–10 mg twice daily, dose increased in resistant oedema

**UNLICENSED USE**

- Not licensed for use in children.

**CAUTIONS**

- Acute porphyrias p. 577

**INTERACTIONS**

→ Appendix 1: thiazide diuretics

**SIDE-EFFECTS**

- Chest pain
- Chills

**BREAST FEEDING**

- The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**DIRECTIONS FOR ADMINISTRATION**

- Tablets may be crushed and mixed with water immediately before use.
9 Patent ductus arteriosus

Drugs affecting the ductus arteriosus

Other drugs used for Patent ductus arteriosus not listed below: ibuprofen, p. 625; Indometacin, p. 628

Closure of the ductus arteriosus

Patent ductus arteriosus is a frequent problem in premature neonates with respiratory distress syndrome. Substantial left-to-right shunting through the ductus arteriosus may increase the risk of intraventricular haemorrhage, necrotising enterocolitis, bronchopulmonary dysplasia, and possibly death. Indometacin p. 628 or ibuprofen p. 625 can be used to close the ductus arteriosus. Indometacin has been used for many years and is effective but it reduces cerebral blood flow, and causes a transient fall in renal and gastro-intestinal blood flow. Ibuprofen may also be used; it has little effect on renal function (there may be a small reduction in sodium excretion) when used in doses for closure of the ductus arteriosus; gastro-intestinal problems are uncommon. If drug treatment fails to close the ductus arteriosus, surgery may be indicated.

Maintenance of patency

In the newborn with duct-dependent congenital heart disease it is often necessary to maintain the patency of the ductus arteriosus whilst awaiting surgery. Alprostadil below (prostagandin E1) and dinoprostone below (prostaglandin E2) are potent vasodilators that are effective for maintaining the patency of the ductus arteriosus. They are usually given by continuous intravenous infusion, but oral dosing of dinoprostone is still used in some centres. During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature. In the event of complications such as apnoea, profound bradycardia, or severe hypotension, the infusion should be temporarily stopped and the complication dealt with; the infusion should be restarted at a lower dose. Recurrent or prolonged apnoea may require ventilatory support in order for the prostaglandin infusion to continue.

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS

Alprostadil

INDICATIONS AND DOSE

Maintaining patency of the ductus arteriosus

BY CONTINUOUS INTRAVENOUS INFUSION

Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.

DINOPROSTONE

Maintaining patency of the ductus arteriosus

BY CONTINUOUS INTRAVENOUS INFUSION

Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.

BY MOUTH

Neonate: 20–25 micrograms/kg every 1–2 hours, then increased if necessary to 40–50 micrograms/kg every 1–2 hours, if treatment continues for more than 1 week gradually reduce the dose.

UNLICENSED USE

Not licensed for use in children.

CONTRA-INDICATIONS

Avoid in hyaline membrane disease.

CAUTIONS

History of haemorrhage.

SIDE-EFFECTS

Cortical hyperostosis (prolonged use) - apnoea (particularly with high doses and in low birth-weight neonates) - bradycardia - bronchospasm - cardiac arrest - diarrohoo - erythema - flushing - gastric outlet obstruction (if used for longer than 5 days) - hypotension - local reactions - nausea - pyrexia - raised white blood cell count - respiratory depression (particularly with high doses and in low birth-weight neonates) - shivering - temporary pyrexia - vomiting.

HEPATIC IMPAIRMENT

Manufacturers advise avoid.

MEDIcinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution.

Tablet

- Metolazone (Non-proprietary)
  - Metolazone 2.5 mg: Zaroxelyn 2.5mg tablets | 100 tablet (PO) no price available

HEPATIC IMPAIRMENT

Manufacturers advise avoid.
10 Vascular disease

Peripheral vascular disease

Raynaud’s syndrome, a vasospastic peripheral vascular disease, consists of recurrent, long-lasting, and episodic vasospasm of the fingers and toes often associated with exposure to cold. Management includes avoidance of exposure to cold and stopping smoking (if appropriate). More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 106 and diltiazem hydrochloride below are useful for reducing the frequency and severity of vasospastic attacks. In very severe cases, where digital infarction is likely, intravenous infusion of the prostacyclin analogue iloprost p. 116 may be helpful.

Vasodilator therapy is not established as being effective for chilblains.

CALCIUM-CHANNEL BLOCKERS

Diltiazem hydrochloride

- INDICATIONS AND DOSE
  - Raynaud’s syndrome
  - BY MOUTH
  - Child 12-17 years: 30–60 mg 2–3 times a day

- UNLICENSED USE Not licensed for use in children.

- CONTRA-INDICATIONS Acute porphyrinas p. 577 · cardiogenic shock · left ventricular failure with pulmonary congestion · second- or third-degree AV block (unless pacemaker fitted) · severe bradycardia · sick sinus syndrome · significant aortic stenosis

- CAUTIONS Bradycardia (avoid if severe) · first degree AV block · heart failure · prolonged PR interval · significantly impaired left ventricular function

- INTERACTIONS → Appendix 1: Calcium channel blockers

- SIDE-EFFECTS
  - Common or very common Asthenia · AV block · bradycardia · dizziness · gastro-intestinal disturbances · headache · hot flushes · hypotension · malaise · oedema (notably of ankles) · palpitation · sino-atrial block
  - Rare Erythema multiforme · exfoliative dermatitis · photosensitivity · rashes
  - Frequency not known Depression · extrapyramidal symptoms · gum hyperplasia · gynaecomastia · hepatitis

Overdose

In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- PREGNANCY Avoid.

- BREAST FEEDING Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

- HEPATIC IMPAIRMENT Reduce dose.

- RENAL IMPAIRMENT Start with smaller dose.

Respiratory system, drug delivery

Inhalation
This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Children and their carers should be advised to follow manufacturers’ instructions on the care and cleansing of inhaler devices.

Inhaler devices
A pressurised metered-dose inhaler is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively, particularly in children under 12 years, a spacer device should also be used (see also NICE guidance). By the age of 3 years, a child can usually be taught to use a spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system. When a pressurised metered-dose inhaler with a spacer is unsuitable or inconvenient, a dry-powder inhaler or breath-actuated inhaler may be used instead if the child is able to use the device effectively.

Dry powder inhalers may be useful in children over 5 years, who are unwilling or unable to use a pressurised metered-dose inhaler with a spacer device; breath-actuated inhalers may be useful in older children if they are able to use the device effectively. The child or child’s carer should be instructed carefully on the use of the inhaler. It is important to check that the inhaler is being used correctly; poor inhalation technique may be mistaken for a lack of response to the drug.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, the child may notice a lack of sensation in the mouth and throat previously associated with each actuation; coughing may occur more frequently following use of a dry-powder inhaler.

CFC-free metered-dose inhalers should be cleaned weekly according to the manufacturer’s instructions.

Spacer devices
Spacer devices are particularly useful for infants, for children with poor inhalation technique, or for nocturnal asthma, because the device reduces the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Smaller-volume spacers may be more manageable for pre-school children and infants. The spacer device used must be compatible with the prescribed metered-dose inhaler.

Use and care of spacer devices
The suitability of the spacer device should be carefully assessed; opening the one-way valve is dependent on the child’s inspiratory flow. Some devices can be tipped to 45° to open the valve during inhaler actuation and inspiration to assist the child.

Inhalation from the spacer device should follow the actuation as soon as possible because the drug aerosol is very short-lived. The total dose (which may be more than a single puff) should be administered as single actuations (with tidal breathing for 10–20 seconds or 5 breaths for each actuation) for children with good inspiratory flow. Larger doses may be necessary for a child with acute bronchospasm.

The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers
Solutions for nebulisation for use in acute severe asthma are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital.

Children with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta, agonist or ipratropium bromide p. 147 to a child with an acute exacerbation of asthma or of airways obstruction;
- to deliver prophylactic medication to a child unable to use other conventional devices;
- to deliver an antibacterial (such as colistimethate sodium p. 331 or tobramycin p. 300) to a child with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide p. 155 to a child with severe croup.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30% it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition. The type of
Nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution. Nebulised bronchodilators are appropriate for children with chronic persistent asthma or those with severe acute asthma. In chronic asthma, nebulised bronchodilators should only be used to relieve persistent daily wheeze, however, with the development of spacers with facemasks, it is now unusual for a child to require long-term nebulised asthma therapy. The use of nebulisers in chronic persistent asthma should be considered only:

- after a review of the diagnosis and use of current inhaler devices;
- if the airflow obstruction is significantly reversible by bronchodilators without unacceptable side-effects;
- if the child does not benefit from use of conventional inhaler device, such as pressurised metered-dose inhaler plus spacer;
- if the child is complying with the prescribed dose and frequency of anti-inflammatory treatment including regular use of high-dose inhaled corticosteroid.

When a nebuliser is prescribed, the child or child’s carer must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (and on peak-flow monitoring);
- be instructed not to treat acute attacks without also seeking medical help;
- have regular follow up with doctor or specialist nurse.

**Jet nebulisers**

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should always be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency.

**Safe practice**

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

**Nebuliser diluent**

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

**Oral**

Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Oral corticosteroids, theophylline p. 162, and leukotriene receptor antagonists are sometimes required for the management of asthma. Oral administration of a beta_2_ agonist is generally not recommended for children, but may be necessary in infants and young children who are unable or unwilling to use an inhaler device.

**Parenteral**

Drugs such as beta_2_ agonists, corticosteroids, and aminophylline p. 161 can be given by injection in acute severe asthma when drug administration by nebulisation is inadequate or inappropriate; in these circumstances the child should generally be treated in a high dependency or intensive care unit.

### Peak flow meters

Peak flow meters may be used to assess lung function in children over 5 years with asthma, but symptom monitoring is the most reliable assessment of asthma control. They are best used for short periods to assess the severity of asthma and to monitor response to treatment; continuous use of peak flow meters may detract from compliance with inhalers. Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

- 3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112
- GP practices can obtain supplies through their Area Team stores.
- NHS Hospitals can order supplies from [www.nhsforms.co.uk/](http://www.nhsforms.co.uk/) or by emailing nhsforms@mmm.com.
- In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

**NICE technology appraisals (TAs)**

**Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10**

When selecting inhaler devices for children under 5 years with chronic asthma, a child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

[www.nice.org.uk/TA10](http://www.nice.org.uk/TA10)

**Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38**

When selecting inhaler devices for children between 5–15 years with chronic asthma, a child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

[www.nice.org.uk/TA38](http://www.nice.org.uk/TA38)

### 1 Airways disease, obstructive

**Asthma**

**Description of condition**

Asthma is a common chronic inflammatory condition of the airways characterised by bronchoconstriction. The most frequent symptoms are cough, wheezing, chest tightness, and shortness of breath. The bronchoconstriction is usually reversible (either spontaneously or with the aid of medication) leading to intermittent symptoms, but in some patients with chronic asthma the inflammation may result in irreversible airway obstruction. Occasionally, asthma symptoms can get gradually or suddenly worse provoking an acute asthma attack that, if severe, may require hospitalisation.
Aims of treatment

In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, and normal lung function (in practical terms FEV₁ and/or peak flow > 80% predicted or best).

Lifestyle changes

Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger to themselves and their children with asthma, of smoking, and be offered appropriate support to stop smoking. Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment in order to improve quality of life and reduce symptoms.

Management of chronic asthma

A stepwise approach aims to stop symptoms quickly and to improve peak flow. Start at the step most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and stepping down treatment when control is good. Before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute attacks.

Child over 5 years

Step 1—Mild intermittent asthma

- Start inhaled short-acting beta₂ agonist (such as salbutamol p. 150 or terbutaline sulfate p. 152) as required.
- Children using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. Inhaled ipratropium bromide p. 147 also acts as a short-acting bronchodilator but inhaled short-acting beta₂ agonists are preferred.
- Move to step 2 if the child presents with any one of the following features; is using an inhaled beta₂ agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week, or has had an asthma attack in the last 2 years.

Step 2—Regular preventer therapy

- Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline p. 162, inhaled sodium cromoglicate p. 161, or inhaled nedocromil sodium p. 161, but are less effective).
- Note, inhaled standard-dose corticosteroid Child over 12 years: 200–800 micrograms/day beclometasone dipropionate p. 154 or equivalent Child 5–12 years: 200–400 micrograms/day beclometasone dipropionate or equivalent
- Beclometasone dipropionate and budesonide p. 155 are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 156 provides equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.
- Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 156) should be initially taken twice daily, however, the same total daily dose can be considered once a day if good control is established.

Child under 5 years

Step 1—Mild intermittent asthma

- Inhaled short-acting beta₂ agonist (such as salbutamol or terbutaline sulfate) as required.
- Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.
- Move to step 2 if the child presents with any one of the following features; is using an inhaled beta₂ agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week.

Step 2—Regular preventer therapy

- Consider adding regular standard-dose inhaled corticosteroid.
- If child is unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast) is an effective first-line preventer.
- Note, inhaled standard-dose corticosteroid Child under 5 years: 200–400 micrograms/day beclometasone dipropionate or equivalent
- Beclometasone dipropionate and budesonide are approximately equivalent in clinical practice although there may be variations with different drug delivery devices.
Fluticasone provides equal clinical activity to beclometasone dipropionate and budesonide at half the dosage. Start inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained.

In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density and adrenal suppression, see individual drug monographs for monitoring information.

If asthma is not adequately controlled, move to step 3. 

**Step 3—Initial add-on therapy**
- If children 2–5 years, add a leukotriene receptor antagonist if not added during step 2. If a leukotriene receptor antagonist was added at step 2, reconsider addition of standard-dose inhaled corticosteroid.
- In children under 2 years, consider proceeding to step 4.

**Step 4—Persistent poor control**
- Refer child to respiratory paediatrician.

**Stepping down**
- Once asthma is controlled, it is recommended to step down therapy and continue to regularly review the child. When deciding which drug to step down first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effects achieved, and the child’s preference, should be considered.
- The child should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as children deteriorate at different rates.

**Pregnancy and breast-feeding**
- Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Short-acting beta₂ agonists, long-acting beta₂ agonists, oral and inhaled corticosteroids, sodium cromoglicate p. 161, nedocromil sodium p. 161, and oral and intravenous theophyllines can be used as normal during pregnancy. There is limited information on use of leukotriene receptor antagonists during pregnancy, however they may be used if potential benefit outweighs risk. Drugs for asthma, including corticosteroid tablets, can be used as normal and in-line with manufacturers’ recommendations in breast-feeding.
- Severe acute attacks of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta₂ agonist and oral or parenteral administration of a corticosteroid; prednisolone p. 421 is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia.

**Management of acute asthma**

**Child over 2 years**

**Levels of severity**
The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

**Moderate acute asthma**
- Able to talk in sentences
- Arterial oxygen saturation (SpO₂) ≥ 92%

**Severe acute asthma**
- Can’t complete sentences in one breath or too breathless to talk or feed
- SpO₂ < 92%
- Peak flow ≤ 50% best or predicted
- Heart rate ≤ 140/minute in children aged 2–5 years; heart rate ≤ 125/minute in children over 5 years
- Respiratory rate ≤ 40/minute in children aged 2–5 years; respiratory rate ≤ 30/minute in children aged over 5 years

Any one of the following in a child with severe asthma:
- SpO₂ < 92%
- Peak flow < 33% best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

**Management of acute asthma in children over 2 years**
- Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or SpO₂ < 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta₂ agonist (salbutamol p. 150 or terbutaline sulfate p. 152) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone p. 420 should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide p. 147 can be combined with beta₂ agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 571 to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised beta₂ agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in patients with unreliable inhalation or severe refractory asthma. Aminophylline p. 161 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids.

Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate has been used for acute asthma [unlicensed use] although its place in management is not yet established.
Child under 2 years

Inhaled short-acting beta₂ agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks. For more severe symptoms, inhaled ipratropium bromide p. 147 in combination with an inhaled beta₂ agonist is also an option.

Follow up in all cases

Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Children and their carers should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the child’s GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Children who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission.

Bronchodilators

Beta₂ agonists

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist is used for immediate relief of asthma symptoms while a long-acting beta₂ agonist is used in addition to an inhaled corticosteroid in children requiring prophylactic treatment.

The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol p. 150 or terbutaline sulfate p. 152 are the safest and most effective short-acting beta₂ agonists for the treatment of asthma.

Adrenaline/epinephrine p. 132 (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, and in cardiopulmonary resuscitation; it is also used as a nebuliser solution to treat severe croup.

Short-acting beta₂ agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta₂ agonist such as salbutamol or terbutaline sulfate. If beta₂ agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach.

A short-acting beta₂ agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta₂ agonists

Formoterol fumarate p. 148 (eflornitrometer) and salmeterol p. 149 are longer-acting beta₂ agonists which are administered by inhalation. They should be used for asthma only in children who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Vilanterol is a long-acting beta₂ agonist available in a combination inhaler with fluticasone furoate.

Combination inhalers that contain a long-acting beta₂ agonist and a corticosteroid ensure that long-acting beta₂ agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Oral

Oral preparations of beta₂ agonists may be used for children if an inhaler device cannot be used but inhaled beta₂ agonists are more effective and have fewer side-effects. A modified-release formulation of salbutamol may be of value in nocturnal asthma as an alternative to modified-release theophylline p. 162 preparations, but an inhaled long-acting beta₂ agonist is preferable.

Parenteral

Beta₂ agonists can be given intravenously in children with severe or life-threatening acute asthma. Chronic asthma unresponsive to stepwise treatment may benefit from continuous subcutaneous infusion of a beta₂ agonist, but this should be used only under the supervision of a respiratory specialist; the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started.

Antimuscarinic bronchodilators

Ipratropium bromide p. 147 by nebulisation can be added to other standard treatment in life-threatening acute asthma or if acute asthma fails to improve with standard therapy. Ipratropium bromide can be used to provide short-term relief in chronic asthma, but short-acting beta₂ agonists act more quickly and are preferred.

The aerosol inhalation of ipratropium bromide has a maximum effect 30–60 minutes after use; its duration of action is 3 to 6 hours.

Theophylline

Theophylline is a xanthine used as a bronchodilator in asthma. It may have an additive effect when used in conjunction with small doses of beta₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 161, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone.

Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations

In general, children are best treated with single-ingredient preparations, such as a selective beta₂ agonist or ipratropium bromide, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations.

Croup

Management

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 419) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 421 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 155 (by nebulisation) will often reduce...
symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 132 should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

### Oxygen

#### Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; administration of an inappropriate concentration of oxygen may have serious or even fatal consequences. High concentrations of oxygen can cause pulmonary epithelial damage (bronchopulmonary dysplasia), convulsions, and retinal damage, especially in preterm neonates.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation. In most acutely ill children with an expected or known normal or low arterial carbon dioxide ($P_{CO_2}$), oxygen saturation should be maintained above 92%; some clinicians may aim for a target of 94–98%. In some clinical situations, such as carbon monoxide poisoning, it is more appropriate to aim for the highest possible oxygen saturation until the child is stable.

Hypercapnic respiratory failure is rare in children; in those with conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_{O_2}$) is usually associated with low or normal arterial carbon dioxide ($P_{CO_2}$), and therefore there is little risk of hyperventilation and carbon dioxide retention.

In severe acute asthma, the arterial carbon dioxide ($P_{CO_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{CO_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Oxygen should not be given to neonates except under expert supervision. Particular care is required in preterm neonates because of the risk of hyperoxia.

#### High concentration oxygen therapy

High concentration oxygen therapy is safe in un-complicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_{O_2}$) is usually associated with low or normal arterial carbon dioxide ($P_{CO_2}$), and therefore there is little risk of hyperventilation and carbon dioxide retention.

In severe acute asthma, the arterial carbon dioxide ($P_{CO_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{CO_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Oxygen should not be given to neonates except under expert supervision. Particular care is required in preterm neonates because of the risk of hyperoxia.

#### Low concentration oxygen therapy

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for children at risk of hypercapnic respiratory failure, which is more likely in children with:
- advanced cystic fibrosis
- advanced non-cystic fibrosis bronchiectasis
- severe kyphoscoliosis or severe ankylosing spondylitis
- severe lung scarring caused by tuberculosis
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target concentration of 88–92%. The aim is to provide the child with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis.

#### Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by a respiratory care specialist. Carers and children who smoke should be advised of the risks of smoking when receiving oxygen, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

### Long-term oxygen therapy

The aim of long-term oxygen therapy is to maintain oxygen saturation of at least 92%. Children (especially those with chronic neonatal lung disease) often require supplemental oxygen, either for 24-hours a day or during periods of sleep; many children are eventually weaned off long-term oxygen therapy as their condition improves.

Long-term oxygen therapy should be considered for children with conditions such as:
- bronchopulmonary dysplasia (chronic neonatal lung disease);
- congenital heart disease with pulmonary hypertension;
- pulmonary hypertension secondary to pulmonary disease;
- idiopathic pulmonary hypertension;
- sickle-cell disease with persistent nocturnal hypoxia;
- interstitial lung disease and obliterative bronchiolitis;
- cystic fibrosis;
- obstructive sleep apnoea syndrome;
- neuromuscular or skeletal disease requiring non-invasive ventilation;
- pulmonary malignancy or other terminal disease with disabling dyspnoea.

Increased respiratory depression is seldom a problem in children with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; children and their carers should be warned to call for medical help if drowsiness or confusion occurs.

#### Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness.

#### Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for children on long-term oxygen therapy who need to be away from home on a regular basis.

#### Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for children who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a child who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred to a face mask for long-term oxygen therapy from an oxygen concentrator. Nasal cannulas can, however, cause dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the child to talk, eat, and drink, but the concentration of oxygen is not controlled and the method may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is undert ventilating.

#### Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
short-burst (intermittent) oxygen therapy;
long-term oxygen therapy;
ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the consent of the child or carers to pass on the child’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the child or carer to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the child or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the child no longer requires the home oxygen service.

HOOF and further instructions are available at www.bprs.co.uk/oxygen.html.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London East, Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In Scotland refer the child for assessment by a paediatric respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services-(sc).asp.

In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

Antimuscarinics

Antimuscarinics (inhaled)

09-Feb-2016

**CAUTIONS** Bladder outflow obstruction · paroxysmal bronchospasm · prostatic hyperplasia · susceptibility to angle-closure glaucoma

**SIDE-EFFECTS**

- **Common or very common** Constipation · cough · diarrhoea · dry mouth · gastro-intestinal motility disorder · headache · sinusitis
- **Uncommon** Angle-closure glaucoma · atrial fibrillation · blurred vision · dizziness · mydriasis · nasopharyngitis · nausea · palpitation · paroxysmal bronchospasm · pharyngitis · rash · tachycardia · throat irritation · urinary retention
- **Rare** Dental caries

**INDICATIONS AND DOSE**

**Reversible airways obstruction**

- **By Inhalation of Aerosol**
  - Child 1 month–5 years: 20 micrograms 3 times a day
  - Child 6–11 years: 20–40 micrograms 3 times a day
  - Child 12–17 years: 20–40 micrograms 3–4 times a day

**Acute bronchospasm**

- **By Inhalation of Nebulised Solution**
  - Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
  - Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
  - Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

**Severe or life-threatening acute asthma**

- **By Inhalation of Nebulised Solution**
  - Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
  - Child 12–17 years: 500 micrograms every 4–6 hours as required

**PHARMACOKINETICS**

The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

**UNLICENSED USE** The dose of ipratropium for severe or life-threatening acute asthma is unlicensed.

**CAUTIONS** Cystic fibrosis

**CAUTIONS, FURTHER INFORMATION**

- Glaucoma *Acute angle-closure glaucoma* has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the patient’s eyes from nebulised drug or from drug powder.

**INTERACTIONS** → Appendix 1: ipratropium

**SIDE-EFFECTS**

- **Uncommon** Laryngospasm · pharyngeal oedema · stomatitis · vomiting
- **Rare** Ocular accommodation disorder

**PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.

**BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION** If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser Liquid**

- **Ipratropium bromide (Non-proprietary)**
  - Ipratropium bromide 250 microgram per 1 ml Ipratropium bromide 500 micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose [*POT*] £2.93 DT price = £2.60
  - Ipratropium bromide 250 micrograms/1ml nebuliser liquid unit dose vials | 20 unit dose [*POT*] £4.58 DT price = £4.51
  - Ipratropium bromide 250 micrograms/1ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [*POT*] £6.99 DT price = £6.99
  - Ipratropium bromide 500 micrograms/2ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [*POT*] £15.99 DT price = £15.99
Formoterol fumarate
(Eformoterol fumarate)

**BETA2-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING**

### INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy / Night-time asthma in patients requiring long-term regular bronchodilator therapy / Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy / Chronic asthma in patients who regularly use an inhaled corticosteroid

- **Child 6-11 years:** 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- **Child 12-17 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

### BY INHALATION OF POWDER

- **Child 6-11 years:** 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- **Child 12-17 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

### OXIS®

**Chronic asthma**

- **BY INHALATION OF POWDER**
  - **Child 6-17 years:** 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day

### Relief of bronchospasm

- **BY INHALATION OF POWDER**
  - **Child 6-17 years:** 6–12 micrograms

### Prophylaxis of exercise-induced bronchospasm

- **BY INHALATION OF POWDER**
  - **Child 6-17 years:** 6–12 micrograms, dose to be taken before exercise

### PHARMACOKINETICS

At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

### IMPORTANT SAFETY INFORMATION

**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta2 agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
Salmeterol

**INDICATIONS AND DOSE**
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy; Nocturnal asthma in patients requiring long-term regular bronchodilator therapy; Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy; Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

- **BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER**
  - Child 5-11 years: 50 micrograms twice daily
  - Child 12–17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

**PHARMACOKINETICS**
At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

**MEDIKL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**
- Easyhaler (formoterol) (Orion Pharma (UK) Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose
    - 1 dose Formoterol Easyhaler 12micrograms/dose dry powder inhaler | 120 dose [POM] £23.75 DT price = £23.75
- Foradil (Novartis Pharmaceuticals UK Ltd)
  - Formoterol fumarate dihydrate 12 microgram Foradil 12microgram inhalation powder capsules with device |
    - 60 capsule [POM] £28.06 DT price = £28.06
- Oxis Turbohaler (AstraZeneca UK Ltd)
  - Formoterol fumarate dihydrate 6 microgram per 1 dose Oxis 6 Turbohaler | 60 dose [POM] £24.80 DT price = £24.80
  - Formoterol fumarate dihydrate 12 microgram per 1 dose Oxis 12 Turbohaler | 60 dose [POM] £24.80 DT price = £24.80

**Pressurised inhalation**
- Atimos Modulite (Chiesi Ltd)
  - Formoterol fumarate dihydrate 1 microgram per 1 inhalation Atimos Modulite 12micrograms/dose inhaler | 100 dose [POM] £30.06 DT price = £30.06

Combinations available: **Budesonide with formoterol, p. 156** · **Fluticasone with formoterol, p. 157**

**INTERACTIONS**
Appendix 1: beta₂ agonists

**SIDE-EFFECTS**

**PREGNANCY**
Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**
Inhaled drugs for asthma can be taken as normal during breast-feeding.

**CAUTIONS**
High doses of beta₂ agonists can be dangerous in some children

**PREVENTION OF EXERCISE-INDUCED BRONCHOSPASM**

**Rapid-onset bronchodilators**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Salmeterol 25micrograms/dose Accuhaler | 60 dose [POM] £35.11 DT price = £35.11

**Salmeterol (Non-proprietary)**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Salmeterol 25micrograms/dose inhaler CFC free | 120 dose [POM] £29.26 DT price = £29.26

**Neovent (Kent Pharmaceuticals Ltd)**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Neovent 25micrograms/dose inhaler CFC free | 120 dose [POM] £29.26 DT price = £29.26

**Serevent Evohaler (GlaxoSmithKline UK Ltd)**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Serevent 25micrograms/dose Evohaler | 120 dose [POM] £29.26 DT price = £29.26

**Solte (Kent Pharmaceuticals Ltd)**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Solte 25micrograms/dose inhaler CFC free | 120 dose [POM] £19.95 DT price = £19.95

**Vertine (Teva UK Ltd)**
- Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  - 1 dose Vertine 25micrograms/dose inhaler CFC free | 120 dose [POM] £23.40 DT price = £23.40

Combinations available: **Fluticasone with salmeterol, p. 157**

**UNLICENSED USE**
Neovent® not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:
- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**CAUTIONS**
High doses of beta₂ agonists can be dangerous in some children

**INTERACTIONS**

### Salbutamol

*Albuterol*

#### INDICATIONS AND DOSE

**Acute asthma**
- **By Intravenous Injection**
  - Child 1-23 months: 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - Child 2-17 years: 15 micrograms/kg (max. per dose 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- **By Continuous Intravenous Infusion**
  - Child: 1–2 micrograms/kg/minute, adjusted according to response and heart rate, increased if necessary up to 5 micrograms/kg/minute, doses above 2 micrograms/kg/minute should be given in an intensive care setting, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- **Moderate, severe, or life-threatening acute asthma**
  - **By Intravenous Nebulisation Solution**
    - Child 1 month–4 years: 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
    - Child 5–11 years: 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
    - Child 12–17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- **Moderate and severe acute asthma**
  - **By Inhalation of Aerosol**
    - Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms
- **Exacerbation of reversible airways obstruction (including nocturnal asthma)**
  - **Prophylaxis of allergen- or exercise-induced bronchospasm**
    - **By Inhalation of Aerosol**
      - Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
    - **By Mouth**
      - Child 1 month–1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
      - Child 2-5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
      - Child 6–11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
      - Child 12–17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route
- **Severe hyperkalaemia**
  - **By Intravenous Injection**
    - Neonate: 4 micrograms/kg, repeated if necessary, to be administered over 5 minutes.
    - Child: 4 micrograms/kg, repeated if necessary, to be administered over 5 minutes.

#### Pharmacokinetics

At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.
**UNLICENSED USE** Not licensed for use in hyperkalaemia.

- With oral use Syrup and tablets not licensed for use in children under 2 years. Modified-release tablets not licensed for use in children under 3 years.
- With intravenous use Injection and solution for intravenous infusion not licensed for use in children under 12 years. Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

**CAUTIONS** High doses of beta₂ agonists can be dangerous in some children

**INTERACTIONS** → Appendix 1: beta₂ agonists

**SIDE-EFFECTS** Lactic acidosis (with high doses) - nausea

**BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For continuous intravenous infusion, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter [unlicensed]. For intravenous injection, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for Injections.
- When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

**PATIENT AND CARER ADVICE**

For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution. Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze [www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze](http://www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze)

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Salbutamol (Non-proprietary)**
  - Salbutamol (as Salbutamol sulfate) 2 mg
    - 28 tablet [Pos] £10.64 DT price = £104.95
  - Salbutamol (as Salbutamol sulfate) 4 mg
    - 28 tablet [Pos] £108.95 DT price = £107.43

### Inhalation powder

- **Easyhaler (salbutamol)** (Orion Pharma (UK) Ltd)
  - Salbutamol 100 microgram per 1 dose
    - Easyhaler Salbutamol sulfate 100micrograms/dose dry powder inhaler | 200 dose [Pos] £5.31 DT price = £3.31
  - Salbutamol 200 microgram per 1 dose
    - Easyhaler Salbutamol sulfate 200micrograms/dose dry powder inhaler | 200 dose [Pos] £6.63 DT price = £6.63

- **Salbutin Novolizer** (Meda Pharmaceuticals Ltd)
  - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
    - Salbutin Novolizer 100micrograms/dose inhalation powder | 200 dose [Pos] £4.95
  - Salbutin Novolizer 100micrograms/dose inhalation powder refill | 200 dose [Pos] £2.75

- **Ventolin Accuhaler** (GlaxoSmithKline UK Ltd)
  - Salbutamol 200 microgram per 1 dose
    - Ventolin 200micrograms/dose Accuhaler | 60 dose [Pos] £3.60 DT price = £3.60

**Solution for injection**

- **Ventolin** (GlaxoSmithKline UK Ltd)
  - Salbutamol (as Salbutamol sulfate) 500 microgram per 1 ml
    - Ventolin 500micrograms/1ml solution for injection ampoules | 5 ampoule [Pos] £1.91

**Solution for infusion**

- **Ventolin** (GlaxoSmithKline UK Ltd)
  - Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml
    - Ventolin 5mg/5ml solution for infusion ampoules | 10 ampoule [Pos] £24.81

**Oral solution**

- **Salbutamol (Non-proprietary)**
  - Salbutamol (as Salbutamol sulfate) 400 microgram per 1 dose
    - Salbutamol 2mg/5ml oral solution sugar free sugar-free | 150 ml [Pos] no price available DT price = £1.15
  - **Ventolin** (GlaxoSmithKline UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 400 microgram per 1 ml
      - Ventolin 2mg/5ml syrup sugar-free | 150 ml [Pos] £1.15 DT price = £1.15

**Pressurised inhalation**

- **Salbutamol (Non-proprietary)**
  - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
    - Ventolin 100micrograms/dose inhaler CFC free | 200 dose [Pos] £1.50 DT price = £1.50
  - **AirSALB** (Sandoz Ltd)
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
      - AirSALB 100micrograms/dose inhaler CFC free | 200 dose [Pos] £1.50 DT price = £1.50
  - **Airomir** (Teva UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
      - Airomir 100micrograms/dose inhaler | 200 dose [Pos] £1.97 DT price = £1.50

- **Teva** (Teva UK Ltd)
  - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose | 200 dose [Pos] £6.63 DT price = £6.36
  - **Salamol** (Teva UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
      - Salbutamol 100micrograms/dose inhaler CFC free | 200 dose [Pos] £1.46 DT price = £1.50
  - **Salamol Easi-Breathe** (Teva UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
      - Salbutamol 100micrograms/dose Easi-Breathe inhaler | 200 dose [Pos] £6.30 DT price = £6.30
  - **Ventolin Evohaler** (GlaxoSmithKline UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose
      - Ventolin 100micrograms/dose Evohaler | 200 dose [Pos] £1.50 DT price = £1.50

**Nebuliser liquid**

- **Salbutamol (Non-proprietary)**
  - Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml
    - Salbutamol 2.5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose [Pos] £1.91 DT price = £1.91
  - Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml
    - Salbutamol 5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose [Pos] £3.82 DT price = £3.82
  - **Salamol Steri-Neb** (Teva UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml
      - Salamol 2.5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [Pos] £1.91 DT price = £1.91
  - Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml
    - Salamol 5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [Pos] £3.82 DT price = £3.82
  - **Ventolin** (GlaxoSmithKline UK Ltd)
    - Salbutamol (as Salbutamol sulfate) 5 mg per 1 ml
      - Ventolin 5mg/ml respirator solution | 20 ml [Pos] £2.18 DT price = £2.18
    - **Ventolin Nebules** (GlaxoSmithKline UK Ltd)
      - Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml
        - Ventolin 2.5mg Nebules | 20 unit dose [Pos] £1.65 DT price = £1.91
      - Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml
        - Ventolin 5mg Nebules | 20 unit dose [Pos] £2.78 DT price = £3.82

Airways disease, obstructive 151
Terbutaline sulfate

- **INDICATIONS AND DOSE**
  - **Acute asthma**
    - **BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
      - Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
    - Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **Moderate, severe, or life-threatening acute asthma**
    - **BY INHALATION OF NEBULISED SOLUTION**
      - Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
      - Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
      - Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - **Exacerbation of reversible airways obstruction (including nocturnal asthma) Prevention of exercise-induced bronchospasm**
    - **BY INHALATION OF POWDER**
      - Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only
    - **BY MOUTH**
      - Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
      - Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
      - Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

**PHARMACOKINETICS**
At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.
- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS** Nausea
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
  - When used by inhalation For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
- **PATIENT AND CARER ADVICE**
  For *inhalation by dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
    - **Solution for injection**
      - **Bricanyl** (AstraZeneca UK Ltd)
        - Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoules [PoM] £16.74
        - Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £2.16

**CORTICOSTEROIDS**

**Airways disease, use of corticosteroids**

**Asthma**

Inhaled corticosteroids
Corticosteroids are effective in the management of *asthma*; they reduce airway inflammation.

An inhaled corticosteroid is used regularly for prophylaxis of asthma when a child requires a beta₂ agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the child has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid.

Current or previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation but may take longer.

Beclometasone dipropionate p. 154, budesonide p. 155, fluticasone p. 156, and mometasone furoate p. 158 appear to be equally effective. A spacer device should be used for administering inhaled corticosteroids in children under 15 years; a spacer device is also useful in children over 15 years, particularly if high doses are required.

In children 12–18 years using an inhaled corticosteroid and a long-acting beta₂ agonist for the prophylaxis of asthma, but who are poorly controlled, Symbicort® (budesonide with formoterol p. 156) may be used as a
Candidiasis
Inhaled drugs for asthma can be taken as a reliever (instead of a short-acting beta; agonist), in addition to its regular use for the prophylaxis of asthma [unlicensed]. Symbicort® can also be used in this way in children 12–18 years using a inhaled corticosteroid with a dose greater than 400 micrograms beclometasone dipropionate daily, but who are poorly controlled [unlicensed] (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular dose of inhaled corticosteroid should not be reduced. Children and their carers must be carefully instructed on the appropriate dose and management of exacerbations before initiating this treatment, preferably by a respiratory specialist. Children using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. This management approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta₂ agonists.

High doses of inhaled corticosteroids can be prescribed for children who respond only partially to standard doses of an inhaled corticosteroid and a long-acting beta₂ agonist or to other long-acting bronchodilators. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded; however, if a higher dose is required it should be initiated and supervised by a respiratory paediatrician. The use of high doses of an inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Oral corticosteroids
Systemic therapy may be required during periods of stress, such as during severe infections, or when airways obstruction or mucus prevent drug access to smaller airways.

An acute attack of asthma should be treated with a short course (3–5 days) of oral corticosteroid. The dose can usually be stopped abruptly but it should be reduced gradually in children under 12 years who have taken corticosteroids for more than 14 days. Tapering is not needed in children 12–18 years provided that the child receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks).

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Some clinicians use alternate-day dosing of an oral corticosteroid.

Parenteral corticosteroids
Hydrocortisone injection p. 420 has a role in the emergency treatment of acute severe asthma.

Corticosteroids (inhaled)

- **SIDE-EFFECTS**
  - **Very rare** Paradoxical bronchospasm
  - **Frequency not known** Adrenal crisis (with prolonged high doses) - adrenal suppression (with prolonged high doses) - aggression - anxiety - behavioural changes - bruising - candidiasis of the mouth - candidiasis of the throat - cataracts - coma (with prolonged high doses) - Cushing’s syndrome (with moon face, striae and acne) - depression - dysphonia - glaucoma (with prolonged high doses) - hoarseness - hyperactivity - hyperglycaemia (usually only with high doses) - irritability - reduced growth velocity - reduced mineral bone density (with long-term treatment of high doses) - side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use · sleep disturbances · throat irritation

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.
  - Paradoxical bronchospasm The potential for paradoxical bronchospasm (coughing for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.

- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TA131**
      For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended.
      For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
      - the use of a combination inhaler within its marketing authorisation is recommended as an option;
      - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
      - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.
      [www.nice.org.uk/TA131](http://www.nice.org.uk/TA131)
    - **Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138**
      For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.
      For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
      - the use of a combination inhaler within its marketing authorisation is recommended as an option;
      - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
      - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.
      [www.nice.org.uk/TA138](http://www.nice.org.uk/TA138)
## Beclometasone dipropionate

(Tricortone, Salbutamol) (Beclomethasone dipropionate)

### INDICATIONS AND DOSE

**Prophylaxis of asthma**

- **CHILD 5**
  - 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
  - 12–17 years: 200–400 micrograms twice daily; increased dose to up to 400 micrograms twice daily

**Caution:** Switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response.

**Patient and Carer Advice**

Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children leaflet: beclometasone for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

**Profession Specific Information**

Dental practitioners’ formulary Cenil Modulite® 50 micrograms/metered inhalation may be prescribed.

### PREPARATIONS

**Unlicensed Use** Easyhaler® Beclometasone Dipropionate is not licensed for use in children under 18 years. Cenil Modulite® 200 and 250 are not licensed for use in children under 12 years.

### IMPORTANT SAFETY INFORMATION

MHRA/CHM Advice (July 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Cenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Cenil Modulite®.

**Interactions** → Appendix 1: corticosteroids

**Prescribing and Dispensing Information** The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.

Cenil Modulite® Cenil Modulite® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

Qvar® Preparations When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When

### INDICATIONS AND DOSE

**Bronchopulmonary dysplasia with spontaneous respiration**
- By Inhalation of Nebulised Suspension
- Neonate: 500 micrograms twice daily.
- Child 1–4 months: 500 micrograms twice daily

**Bronchopulmonary dysplasia with spontaneous respiration (severe symptoms)**
- By Inhalation of Nebulised Suspension
- Child 1–4 months (body-weight 2.5 kg and above): 1 mg twice daily

**Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**
- By Inhalation of Powder
- Child 6–11 years: 200–400 micrograms once daily, dose to be given in the evening
- Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

**Prophylaxis of asthma**
- By Inhalation of Powder
- Child 6–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary

**Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose**
- By Inhalation of Powder
- Child 5–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary

### POTENCY

Dose adjustments may be required for some inhaler devices, see under individual preparations.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- **Budelin Novolizer (Meda Pharmaceuticals Ltd)**
  - Budesonide 200 microgram per 1 dose: Budelin Novolizer 200 micrograms/dose inhalation powder | 100 dose [PoM] £14.86
  - Budelin Novolizer 200 micrograms/dose inhalation powder refill | 100 dose [PoM] £9.59

- **Easyhaler (budesonide)** (Orion Pharma (UK) Ltd)
  - Budesonide 200 microgram per 1 dose: Easyhaler Budesonide 200 micrograms/dose dry powder inhaler | 200 dose [PoM] £8.86

- **Pulmicort Turboshaler** (AstraZeneca UK Ltd)
  - Budesonide 200 microgram per 1 dose: Pulmicort 100 Turboshaler | 200 dose [PoM] £11.84
  - Budesonide 200 microgram per 1 dose: Pulmicort 200 Turboshaler | 100 dose [PoM] £11.71

- **Budesonide 400 microgram per 1 dose**
  - Pulmicort 400 Turboshaler | 500 dose [PoM] £13.86

**Nebuliser liquid**

- **Budesonide (Non-proprietary)**
  - Budesonide 250 microgram per 1 ml: Budesonide 500 micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £30.40

- **Budesonide 500 microgram per 1 ml**
  - Pulmicort 0.5mg Respules | 20 unit dose [PoM] £26.42
  - Pulmicort Respules (AstraZeneca UK Ltd)

- **Budesonide 250 microgram per 1 ml**
  - Pulmicort 0.5mg Respules | 20 unit dose [PoM] £42.41

### UNLICENSED USE

Pulmicort® nebuliser solution not licensed for use in children under 3 months; not licensed for use in bronchopulmonary dysplasia.

### INTERACTIONS

→ Appendix 1: corticosteroids

### DIRECTIONS FOR ADMINISTRATION

Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.

### PATIENT AND CARER ADVICE

With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer budesonide dry powder inhaler and nebuliser suspension.

Medicines for Children leaflet: Budesonide inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/budesonide-inhaler-asthma-prevention-prophylaxis

Budelin Novolizer®. Patients or carers should be given advice on administration of Budelin Novolizer®.
Budesonide with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 155, formoterol fumarate p. 148.

- **INDICATIONS AND DOSE**

**SYMPLICORT 100/6 TURBOHALER®**

Asthma, maintenance therapy
- BY INHALATION OF POWDER
  - Child 6–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
- BY INHALATION OF POWDER
  - Child 12–17 years: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; maximum 8 puffs per day

**SYMPLICORT 200/6 TURBOHALER®**

Asthma, maintenance therapy
- BY INHALATION OF POWDER
  - Child 12–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
- BY INHALATION OF POWDER
  - Child 12–17 years: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; maximum 8 puffs per day

**SYMPLICORT 400/12 TURBOHALER®**

Asthma, maintenance therapy
- BY INHALATION OF POWDER
  - Child 12–17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**UNLICENSED USE**

**SYMPLICORT 100/6 TURBOHALER®** Symbicort® not licensed for use in children for asthma maintenance and reliever therapy.

**SYMPLICORT 200/6 TURBOHALER®** Symbicort® not licensed for use in children for asthma maintenance and reliever therapy.

- **INTERACTIONS** → Appendix 1: beta₂ agonists, corticosteroids
- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied.
  Patients counselling is advised for budesonide with formoterol dry powder inhalation (administration).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**INHALATION POWDER**

**SYMPLICORT 200/6 TURBOHALER®**

Budesonide 200 microgram per 1 dose, Formoterol fumarate dihydrate 6 microgram per 1 dose
- Budesonide 100 microgram per 1 dose Symicort 100/6 Turbohaler | 120 dose £33.00 DT price = £33.00
- Budesonide 200 microgram per 1 dose Symicort 200/6 Turbohaler | 120 dose £36.00 DT price = £36.00

- Formoterol fumarate dihydrate 12 microgram per 1 dose, Budesonide 400 microgram per 1 dose Symicort 400/12 Turbohaler | 60 dose £38.00 DT price = £38.00

**Ciclesonide**

- **INDICATIONS AND DOSE**

Prophylaxis of asthma
- BY INHALATION OF AEROSOL
  - Child 12–17 years: 160 micrograms once daily; reduced to 80 micrograms daily, if control maintained

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Nausea; taste disturbance

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ciclesonide aerosol inhaler.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**PRESSURISED INHALATION**

**CAUTIONARY AND ADVISORY LABELS** 8

- **SYMPLICORT 100/6 TURBOHALER®**

- **Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose,** Fluticasone propionate 125 microgram per 1 dose **Seretide 125 Enohaler** | 120 dose | £35.00 DT price = £35.00
- **Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose,** Fluticasone propionate 250 microgram per 1 dose **Seretide 250 Enohaler** | 120 dose | £59.48 DT price = £59.48

## Mometasone furoate

### INDICATIONS AND DOSE

**Prophylaxis of asthma**
- **By inhalation of powder**
- Child 12-17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained

**Prophylaxis of severe asthma**
- **By inhalation of powder**
- Child 12-17 years: Increased if necessary up to 400 micrograms twice daily

### INTERACTIONS
- Appendix 1: corticosteroids

### SIDE-EFFECTS
- **Common or very common** Headache
- **Uncommon** Dyspepsia; palpitation; weight gain

### PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied.
- Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) [www.medicinesforchildren.org.uk](http://www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis)

### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**
- The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

**CAUTIONARY AND ADVISORY LABELS** 8, 10
- **Asmanex Twirhaler** (Merck Sharp & Dohme Ltd)
  - **Mometasone furoate 200 microgram per 1 dose** Asmanex 200micrograms/dose Twirhaler | 30 dose | £15.70 DT price = £15.70 | 60 dose | £23.54 DT price = £23.54
  - **Mometasone furoate 400 microgram per 1 dose** Asmanex 400micrograms/dose Twirhaler | 30 dose | £21.78 | 60 dose | £36.05 DT price = £36.05

### IMMUNOSUPPRESSANTS

#### Monoclonal Antibodies

### Omalizumab

### INDICATIONS AND DOSE

**Prophylaxis of severe persistent allergic asthma**
- **By subcutaneous injection**
- Child 6-17 years: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

**Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment**
- **By subcutaneous injection**
- Child 12-17 years: 300 mg every 4 weeks

### CAUTIONS
- Autoimmune disease; susceptibility to helminth infection—discontinue if infection does not respond to anthelminthic

### INTERACTIONS
- Appendix 1: monoclonal antibodies

### SIDE-EFFECTS
- **Common or very common** Abdominal pain; arthralgia; headache; injection-site reactions; pyrexia; sinusitis; upper respiratory tract infection
- **Uncommon** Bronchospasm; cough; diarrhoea; dizziness; drowsiness; dyspepsia; flushing; influenza-like illness; malaise; nausea; paraesthesia; pharyngitis; photosensitivity; postural hypotension; pruritus; rash; syncope; urticaria; weight gain
- **Rare** Angioedema; antibody formation; laryngedema; parasitic infection
- **Frequency not known** Alopecia; arterial thromboembolic events; Churg-Strauss syndrome; joint swelling; myalgia; serum sickness (including fever and lymphadenopathy); thrombocytopenia

### SIDE-EFFECTS, FURTHER INFORMATION
- **Churg-Strauss syndrome** Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.
- **Hypersensitivity reactions** Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.
- **Pregnancy** Manufacturer advises avoid unless essential—crosses the placenta.
- **Breast Feeding** Manufacturer advises avoid—present in milk in animal studies.
- **Hepatic Impairment** Manufacturer advises caution—no information available.
LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonists

Overview
The leukotriene receptor antagonists, montelukast below and zafirlukast p. 160, block the effects of cysteinyl leukotrienes in the airways; they can be used in children for the management of chronic asthma with an inhaled corticosteroid or as an alternative if an inhaled corticosteroid cannot be used.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in children with severe asthma who are also receiving high doses of other drugs.

There is some limited evidence to support the intermittent use of montelukast in children under 12 years with episodic wheeze associated with viral infections [unlicensed use]. Treatment is started at the onset of either asthma symptoms or of coryzal symptoms and continued for 7 days; there is no evidence to support this use in moderate or severe asthma.

Montelukast

- INDICATIONS AND DOSE
  - Prophylaxis of asthma
    - BY MOUTH
      - Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
      - Child 6–14 years: 5 mg once daily, dose to be taken in the evening
      - Child 15–17 years: 10 mg once daily, dose to be taken in the evening

  - Symptomatic relief of seasonal allergic rhinitis in patients with asthma.
    - BY MOUTH
      - Child 6–17 years: 10 mg once daily, dose to be taken in the evening

- INTERACTIONS
  - Appendix 1: montelukast

- SIDE-EFFECTS
  - Common or very common
    - Abdominal pain, headache, hyperkinesia (in young children), thirst
  - Uncommon
    - Abnormal dreams, agitation, anxiety, arthralgia, bruising, depression, diziness, drowsiness, dry mouth, dyspepsia, epistaxis, hostility, hypoesthesia, irritability, malaise, muscle cramps, myalgia, oedema, paraesthesia, psychomotor hyperactivity, restlessness, seizures, sleep disturbances, sleep-walking

  - Rare
    - Disturbance in attention, increased bleeding tendency, memory impairment, palpitation, tremor

  - Very rare
    - Churg–Strauss syndrome, disorientation, erythema multiforme, erythema nodosum, hallucinations, hepatic disorders, hepatic eosinophilic infiltration, suicidal behaviour, suicidal thoughts

SIDE-EFFECTS, FURTHER INFORMATION
Churg-Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- PREGNANCY
  - Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Solution for injection
    - Xolair (Novartis Pharmaceuticals UK Ltd)
      - Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £256.15
      - Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £128.07

  - National funding/access decisions

  - NICE technology appraisals (TAs)
    - Omalizumab for severe persistent allergic asthma (April 2013) NICE TA278
      - Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:
        - who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
        - only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme. Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta, agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

      - Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

      - www.nice.org.uk/TA278
    - Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339
      - Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:
        - the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
        - the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,
        - omalizumab is stopped at before the fourth dose if the condition has not responded,
        - omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
        - omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
        - the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

      - Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

      - www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

Nedocromil sodium

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

▶ **BY INHALATION OF AEROSOL**

> Child 5-17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

**DOSE EQUIVALENCE AND CONVERSION**

> 2 puffs = 4 mg.

**UNLICENSED USE** Not licensed for use in children under 6 years.

**SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · dyspepsia · nausea · pharyngitis · vomiting

▶ **Rare** Taste disturbances

▶ **Frequency not known** Bronchospasm · cough · headache · paradoxical bronchospasm · throat irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Paradoxical bronchospasm: If paradoxical bronchospasm occurs, a short-acting beta, agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

**PREGNANCY** Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

**BREAST FEEDING** Unlikely to be present in milk. Inhaled drugs can be taken as normal during breast-feeding.

**TREATMENT CESSATION**

Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.

**DIRECTIONS FOR ADMINISTRATION** Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cool water before taking.

**PATIENT AND CARER ADVICE**

Regular use is necessary. Patient counselling is advised for sodium cromoglicate for inhalation (administration).

**MEDIcular FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

CAUTIONARY AND ADVISORY LABELS 8

▶ **Tilade** (Sanofi)

Nedocromil sodium 2 mg per 1 dose

Tilade 2 mg/dose inhaler CFC free | 112 dose | £39.94

Sodium cromoglicate (Sodium cromoglycate)

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

▶ **BY INHALATION OF AEROSOL**

> Child 5-17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

**Food allergy (in conjunction with dietary restriction)**

▶ **BY MOUTH**

> Child 2-13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

> Child 14-17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

**CAUTIONS**

▶ When used by inhalation: Discontinue if eosinophilic pneumonia occurs

**SIDE-EFFECTS**

▶ When used by inhalation: Bronchospasm · cough · eosinophilic pneumonia · headache · paradoxical bronchospasm · rhinitis · throat irritation

▶ With oral use: Joint pain · occasional nausea · rashes

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Paradoxical bronchospasm

▶ When used by inhalation: If paradoxical bronchospasm occurs, a short-acting beta, agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

**PREGNANCY**

Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

XANTHINES

Aminophylline

**INDICATIONS AND DOSE**

**Severe acute asthma in patients not previously treated with theophylline**

▶ **BY SLOW INTRAVENOUS INJECTION**

> Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

**Severe acute asthma**

▶ **BY INTRAVENOUS INFUSION**

> Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration

> Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

**Chronic asthma**

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

> Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration continued →
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS
Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

● **UNLICENSED USE**  Aminophylline injection not licensed for use in children under 6 months.
● **CAUTIONS**  Arrhythmias following rapid intravenous injection, cardiac arrhythmias or other cardiac disease, epilepsy, fever, hypertension, hyperthyroidism, peptic ulcer risk of hypokalaemia
● **INTERACTIONS**  → Appendix 1: aminophylline
● **SIDE-EFFECTS**  Arrhythmias (especially if given rapidly by intravenous injection), CNS stimulation, convulsions (especially if given rapidly by intravenous injection), diarrhoea, gastric irritation, headache, hypertension (especially if given rapidly by intravenous injection), insomnia, nausea, palpitation, tachycardia, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hypokalaemia  Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose
Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, diluted pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 803.

● **ALLERGY AND CROSS-SENSITIVITY**  Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

● **PREGNANCY**  Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

● **BREAST FEEDING**  Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

● **HEPATIC IMPAIRMENT**  Reduce dose.

● **MONITORING REQUIREMENTS**
  - Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
  - Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

- If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.

  - With oral use  Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

● **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use  For *intravenous injection*, give very slowly over at least 20 minutes (with close monitoring). For *intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intramuscular use  Aminophylline is too irritant for intramuscular use.

● **PRESCRIBING AND DISPENSING INFORMATION**  Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

  Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

  Modified release  The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

      - **nSpire Piko-1 peak flow meter standard range** (nSpire Health Ltd) | 1 device - NHS indicative price = £9.50 - Drug Tariff (Part IXa) price = £4.50

    - **PINNACLE®**
      - **Pinnacle peak flow meter standard range** (Fyne Dynamics Ltd) | 1 device - NHS indicative price = £6.50 - Drug Tariff (Part IXa) price = £4.50

    - **POCKETPEAK® STANDARD RANGE**
      - **nSpire Pocket Peak flow meter standard range** (nSpire Health Ltd) | 1 device - NHS indicative price = £6.53 - Drug Tariff (Part IXa) price = £4.50

    - **VITALOGRAPH®**
      - **Vitalograph peak flow meter standard range** (Vitalograph Ltd) | 1 device - NHS indicative price = £4.83 - Drug Tariff (Part IXa) price = £4.50

Spacers

- **SPACERS**
  - **A2A SPACER®**
    - For use with all pressurised (aerosol) inhalers.
    - **A2A Spacer** (Clement Clarke International Ltd) | 1 device - NHS indicative price = £4.15 - Drug Tariff (Part IXa)

  - **A2A Spacer with medium mask** (Clement Clarke International Ltd) | 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

  - **A2A Spacer with small mask** (Clement Clarke International Ltd) | 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

  - **ABLE SPACER®**
    - Small-volume device. For use with all pressurised (aerosol) inhalers.
Able Spacer (Clement Clarke International Ltd) | 1 device • NHS indicative price = £4.39 • Drug Tariff (Part IXa)
Able Spacer with medium mask (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)
Able Spacer with small mask (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)
**AEROCAMBER PLUS®**
Medium-volume device. For use with all pressurised (aerosol) inhalers.

**AEROCAMBER PLUS® with adult mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)
**AEROCAMBER PLUS® with child mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)
**AEROCAMBER PLUS® with infant mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)

**BABYHALER®**
For paediatric use with Flixotide®, and Ventolin® inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**
Not available for NHS prescription.

**Babyhaler** (Allen & Hanbury’s Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)

**HALERAL®**
Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**
Not available for NHS prescription.

**Haleraid-120** (Allen & Hanbury’s Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)
**Haleraid-200** (Allen & Hanbury’s Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)

**OPTICHAMBER®**
For use with all pressurised (aerosol) inhalers.

**Optichamber** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £4.28 • Drug Tariff (Part IXa)

**OPTICHAMBER® DIAMOND**
For use with all pressurised (aerosol) inhalers.

**Optichamber Diamond** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £4.49 • Drug Tariff (Part IXa)

**Optichamber Diamond with large LiteTouch mask 5 years-adult** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

**Optichamber Diamond with medium LiteTouch mask 1-5 years** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

**Optichamber Diamond with small LiteTouch mask 0-18 months** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

**POCKET CHAMBER®**
Small volume device. For use with all pressurised (aerosol) inhalers.

**Pocket Chamber** (nSpire Health Ltd) | 1 device • NHS indicative price = £4.18 • Drug Tariff (Part IXa)

**Pocket Chamber with adult mask** (nSpire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with child mask** (nSpire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with infant mask** (nSpire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with teenager mask** (nSpire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**SPACE CHAMBER PLUS®**
For use with all pressurised (aerosol) inhalers.

**Space Chamber Plus** (Medical Developments International Ltd) | 1 device • NHS indicative price = £4.26 • Drug Tariff (Part IXa)

**Space Chamber Plus with large mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

**Space Chamber Plus with medium mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

**Space Chamber Plus with small mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

**VOLUMATIC®**
Large-volume device. For use with Clenil Modulite®, Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers.

**Volumatic** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £3.85 • Drug Tariff (Part IXa)

**Volumatic with paediatric mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £6.77 • Drug Tariff (Part IXa)

**Vortex®**
Medium-volume device. For use with all pressurised (aerosol) inhalers.

**Vortex Spacer** (Pari Medical Ltd) | 1 device • NHS indicative price = £6.28 • Drug Tariff (Part IXa)

**Vortex with child mask 0-2 years** (Pari Medical Ltd) | 1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

**Vortex with child mask 2 years+** (Pari Medical Ltd) | 1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

## 2 Allergic conditions

### Antihistamines, allergen immunotherapy and allergic emergencies

**Antihistamines**

Antihistamines (histamine H₁-receptor antagonists) are classified as sedating or non-sedating, according to their relative potential for CNS depression. Antihistamines differ in their duration of action, incidence of drowsiness, and antimuscarinic effects; the response to an antihistamine may vary from child to child. Either a sedating or a non-sedating antihistamine may be used to treat an acute allergic reaction; for conditions with more persistent symptoms which require regular treatment, a non-sedating antihistamine should be used to minimise the risk of sedation and psychomotor impairment associated with sedating antihistamines.

Oral antihistamines are used in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and may be of some value in vasomotor rhinitis; rhinorhoea and sneezing is reduced, but antihistamines are usually less effective for nasal congestion. Antihistamines are used topically to treat allergic reactions in the eye and in the nose. Topical application of antihistamines to the skin is not recommended.

An oral antihistamine may be used to prevent urticaria, and for the treatment of acute urticarial rashes, pruritus, insect bites, and stings. Antihistamines are also used in the management of nausea and vomiting, of migraine, and the adjunctive management of anaphylaxis and angioedema.

The non-sedating antihistamine cetirizine hydrochloride p. 168 is safe and effective in children. Other non-sedating antihistamines that are used include acrivastine p. 167, bilastine p. 167, desloratadine p. 168 (an active metabolite of loratadine p. 170), fexofenadine hydrochloride p. 169 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 169 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 170. Most non-sedating antihistamines are long-acting (usually 12–24 hours). There is little evidence that desloratadine or levocetirizine...
**Allergic conditions**

hydrochloride confer any additional benefit—they should be reserved for children who cannot tolerate other therapies. *Sedating* antihistamines are occasionally useful when insomnia is associated with urticaria and pruritus. Most of the sedating antihistamines are relatively short-acting, but promethazine may be effective for up to 12 hours. Allimazine tartrate p. 171 and promethazine have a more sedative effect than chlorphenamine maleate p. 172 and cyclizine p. 250. Chlorphenamine maleate is used as an adjunct to adrenaline/epinephrine p. 132 in the emergency treatment of anaphylaxis and angioedema.

**Allergen immunotherapy**

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can improve symptoms of asthma and allergic rhinoconjunctivitis in children. A vaccine containing extracts of wasp and bee venom is recommended for the emergency treatment of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected children.

**Anaphylaxis**

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Children with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 59). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, allergen immunotherapy preparations, antibacterials, aspirin p. 89 and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

**Treatment of anaphylaxis**

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

- securing the airway; restoration of blood pressure (laying the child flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine by intramuscular injection; the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function;
- administering high-flow oxygen and intravenous fluids;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection as adjunctive treatment given after adrenaline.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 150, inhaled ipratropium bromide p. 147, intravenous aminophylline p. 161, or intravenous magnesium sulfate p. 571 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a child is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route, or by the intraosseous route if venous access is difficult; for details see adrenaline/epinephrine.

On discharge, the child should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. The child, or carer, should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Children who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine p. 132 in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Children with severe allergy, and their carers, should ideally be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection. Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).
### Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child 1 month–5 years</td>
<td>150 micrograms</td>
<td>0.15 mL in 1000 (1 mg/mL) adrenaline¹</td>
</tr>
<tr>
<td>Child 6–11 years</td>
<td>300 micrograms</td>
<td>0.3 mL in 1000 (1 mg/mL) adrenaline²</td>
</tr>
<tr>
<td>Child 12–17 years</td>
<td>500 micrograms</td>
<td>0.5 mL in 1000 (1 mg/mL) adrenaline²</td>
</tr>
</tbody>
</table>

*These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.*

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

### Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

Where the child is severely ill and there is real doubt about adequacy of the circulation and absorption from the intramuscular injection site, adrenaline/epinephrine may be given by slow intravenous injection, repeated according to response; if multiple doses are required consider giving adrenaline by slow intravenous infusion.

It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Adrenaline/epinephrine is also given by the intravenous route for acute hypotension.

### Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection, oxygen, antihistamines and corticosteroids should be given as described under Anaphylaxis. Tracheal intubation may be necessary. In some children with laryngeal oedema, adrenaline 1 in 1000 (1 mg/mL) solution may be given by nebuliser. However, nebulised adrenaline/epinephrine cannot be relied upon for a systemic effect—intramuscular adrenaline/epinephrine should be used.

### Hereditary angioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 177 (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical, or surgical procedures. Tranexamic acid p. 80 is used for short-term or long-term prophylaxis of hereditary angioedema; short-term prophylaxis is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards. Danazol [unlicensed indication] is best avoided in children because of its androgenic effects, but it can be used for short-term prophylaxis of hereditary angioedema.

### Antihistamines

#### Acrivastine

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

- **By mouth**
  - Child 12-17 years: 8 mg 3 times a day

**CONTRA-INDICATIONS**

Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe)

**INTERACTIONS**

> Appendix 1: antihistamines (non-sedating)

**SIDE-EFFECTS**

- Uncommon: Antimuscarinic effects – gastro-intestinal disturbances, headache, psychomotor impairment
- Rare: Anaphylaxis, angioedema, arrhythmias, blood disorders, bronchospasm, confusion, convulsions, depression, dizziness, extrapyramidal effects, hypersensitivity reactions, hypotension, liver dysfunction, palpitation, photosensitivity reactions, rashes, sleep disturbances, tremor

**Frequency not known**

Blurred vision, drowsiness, dry mouth, urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood–brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of hypersensitivity to triprolidine

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**RENAI IMPAIRMENT**

Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Although drowsiness is rare, nevertheless children and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Benadryl Allergy Relief (McNeil Products Ltd)
  - Acrivastine 8 mg
  - 24 capsule  £4.95

### Bilastine

**INDICATIONS AND DOSE**

Symptomatic relief of allergic rhinoconjunctivitis and urticaria

- **By mouth**
  - Child 12-17 years: 20 mg once daily

**CONTRA-INDICATIONS**

Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe)

**INTERACTIONS**

> Appendix 1: antihistamines (non-sedating)
Cetirizine hydrochloride

INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis
- BY MOUTH
  - Child 1 year: 250 micrograms/kg twice daily
  - Child 2-5 years: 2.5 mg twice daily
  - Child 6-11 years: 5 mg twice daily
  - Child 12-17 years: 10 mg once daily

UNLICENSED USE Not licensed for use in children under 2 years.

CONTRA-INDICATIONS Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe)

CAUTIONS
- Epilepsy
- INTERACTIONS Appendix 1: antihistamines (non-sedating)
- SIDE-EFFECTS
  - Uncommon Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
  - Rare Anaphylaxis - angioedema - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor
  - Frequency not known Drowsiness

SID-EFFECTS, FURTHER INFORMATION
Non-sedating antihistamines such as cetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

RENAL IMPAIRMENT Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Cetirizine hydrochloride for hay fever www.medicinesforchildren.org.uk/cetirizine-hay-fever-0

Driving and skilled tasks
Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Cetirizine Tablets 10 mg may be prescribed. Cetirizine Oral Solution 5 mg/5 mL may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 23
- Ilaxten (A. Menarini Farmaceutica Internazionale SRL)

  - Levocetirizine dihydrochloride 500 microgram per 1 ml Xyzal 0.5mg/ml oral solution sugar-free | 200 ml (Pom) £6.00 DT price = £6.00

**Tablet**

- **Xyzal** (UCB Pharma Ltd)
  - Levocetirizine dihydrochloride 5 mg Xyzal 5mg tablets | 30 tablets (Pom) £4.39 DT price = £4.36

**Loratadine**

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- **BY MOUTH**
  - Child 2–11 years (body-weight up to 31 kg): 5 mg once daily
  - Child 2–11 years (body-weight 31 kg and above): 10 mg once daily
  - Child 12–17 years: 10 mg once daily

**CAUTIONS** Acute porphyrias p. 577

**INTERACTIONS** → Appendix 1: antihistamines (non-sedating)

**SIDE-EFFECTS**

- **Uncommon** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- **Rare** Anaphylaxis · angioedema · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.

**PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose frequency to alternate days in severe impairment.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Xyzal** (UCB Pharma Ltd)
  - Levocetirizine dihydrochloride 500 microgram per 1 ml Xyzal 0.5mg/ml oral solution sugar-free | 200 ml (Pom) £6.00 DT price = £6.00

- **Tablet**
  - **Xyzal** (UCB Pharma Ltd)
    - Levocetirizine dihydrochloride 5 mg Xyzal 5mg tablets | 30 tablets (Pom) £4.39 DT price = £4.36

**Loratadine**

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- **BY MOUTH**
  - Child 2–11 years (body-weight up to 31 kg): 5 mg once daily
  - Child 2–11 years (body-weight 31 kg and above): 10 mg once daily
  - Child 12–17 years: 10 mg once daily

**CAUTIONS** Acute porphyrias p. 577

**INTERACTIONS** → Appendix 1: antihistamines (non-sedating)

  - **Claritin (Loratadine) (Bayer Plc)**
    - Loratadine 10 mg Claritin Rapid Allergy 10mg tablets sugar-free | 10 tablet (Gss) £3.24
INTERACTIONS ➔ Appendix 1: antihistamines (non-sedating)

SIDE-EFFECTS

- **Common or very common** Anxiety • asthenia • weight gain
- **Uncommon** Antimuscarinic effects • arthralgia • blurred vision • dry mouth • gastro-intestinal disturbances • headache • myalgia • psychomotor impairment • urinary retention
- **Rare** Anaphylaxis • angioedema • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor
- **Frequency not known** Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION

Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT Manufacturer advises avoid in significant impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

- **Mizollon** (Sanofi)

**ANTI-HISTAMINES** ➔ SEDATING

**Alimemazine tartrate**

(Trimetepazine tartrate)

INDICATIONS AND DOSE

Urticaria • Pruritus

- **By mouth**
  - Child 6 months–1 year (specialist use only): 250 micrograms/kg 3–4 times a day (max. per dose 2.5 mg)
  - Child 2–4 years: 2.5 mg 3–4 times a day
  - Child 5–11 years: 5 mg 3–4 times a day
  - Child 12–17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day

Premedication to anaesthesia

- **By mouth**
  - Child 2–6 years: Up to 2 mg/kg, to be given 1–2 hours before operation

UNLICENSED USE Not licensed for use in children under 2 years.

CONTRA-INDICATIONS Children under 2 years except on specialist advice (safety of such use has not been established) • epilepsy • hepatic dysfunction • history of narrow angle glaucoma • hypothyroidism • many antihistamines should be avoided in acute porphyrias p. 577 but alimemazine is thought to be safe • myasthenia gravis • neonate (due to significant antimuscarinic activity) • phaeochromocytoma • renal dysfunction

CAUTIONS Cardiovascular diseases (due to tachycardia- and hypotensive effects of phenothiazines) • exposure to sunlight should be avoided during treatment with high doses • pyloroduodenal obstruction • urinary retention • volume depleted patients who are more susceptible to orthostatic hypotension

INTERACTIONS ➔ Appendix 1: antihistamines (sedating)

SIDE-EFFECTS

- **Rare** Anaphylaxis • angioedema • bronchospasm • hypersensitivity reactions
- **Frequency not known** Acute dystonia • agitation • agranulocytosis • akathisia • akinesia • angle-closure glaucoma • anti-muscarinic effects • arrhythmias (may be predisposed by hypokalaemia and cardiac disease) • blurred vision • contact sensitisation • convulsions • drowsiness • dry mouth • dyskinesia • gastro-intestinal disturbances • headache • hyperprolactinaemia • hypotension • insomnia • jaundice • leukaemia (on prolonged high dose) • nasal stuffiness • neuroleptic malignant syndrome • oculomotor changes • pellor • paradoxical excitement • parkinsonism • photosensitivity • postural hypotension (in volume depletion) • rashes • respiratory depression • rigidity • tardive dyskinesia (usually after prolonged high doses) • tremor • urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT Avoid in severe liver disease—increased risk of coma.

RENAL IMPAIRMENT Avoid.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Alimemazine tartrate (Non-proprietary)**

- **Alimemazine tartrate 1.5 mg per 1 ml** Alimemazine 7.5mg/5ml oral solution | 100 ml [P] £179.54 DT price = £179.54
- **Alimemazine tartrate 6 mg per 1 ml** Alimemazine 30mg/5ml oral solution | 100 ml [P] £243.51 DT price = £243.51
**Chlorphenamine maleate**  
(Chlorpheniramine maleate)

### Indications and Dose
Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions | Relief of itch associated with chickenpox

- **By mouth**
  - Child 1-23 months: 1 mg twice daily
  - Child 2-5 years: 1 mg every 4–6 hours; maximum 6 mg per day
  - Child 6-11 years: 2 mg every 4–6 hours; maximum 12 mg per day
  - Child 12-17 years: 4 mg every 4–6 hours; maximum 24 mg per day

- **By intramuscular injection, or by intravenous injection**
  - Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
  - Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
  - Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
  - Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day

### Emergency treatment of anaphylactic reactions

- **By intramuscular injection, or by intravenous injection**
  - Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
  - Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
  - Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
  - Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day

### Unlicensed use
**Injection** not licensed for use in neonates. **Tablets** not licensed for use in children under 6 years. **Syrup** not licensed for use in children under 1 year.

### Important Safety Information
**MHRA/CHM Advice (March 2008 and February 2009) Over-the-Counter Cough and Cold Medicines for Children**
Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

### Contra-Indications
Many antihistamines should be avoided in acute porphyrias p. 577 but chlorphenamine is thought to be safe - neonate (due to significant antimuscarinic activity)

### Caution
Epilepsy - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

### Interactions
- Appendix I: antihistamines (sedating)

### Side-effects
**General side-effects**
- Common or very common: blurred vision, dry mouth, gastro-intestinal disturbances, headache, psychomotor impairment, urinary retention

**Rare**
- Anaphylaxis - angioedema - arrhythmias - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - sleep disturbances - tremor

**Frequency not known**
- Antimuscarinic effects - blood disorders - exfoliative dermatitis - rashes - tinnitus

### Specific side-effects
- With intramuscular or intravenous use CNS stimulation - irritant effects - transient hypotension

### Side-effects, further information
Children are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**Pregnancy**
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**Breast Feeding**
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**Hepatic Impairment**
Avoid in severe liver disease—increased risk of coma.

**Directions for Administration**
For intravenous injection, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.

**Patient and Carer Advice**
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**Profession Specific Information**
Dental practitioners’ formulae Chlorphenamine tablets may be prescribed. Chlorphenamine oral solution may be prescribed.

**Exceptions to Legal Category**
Prescription only medicine restriction does not apply to chlorphenamine injection where administration is for saving life in emergency.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Solution for injection
- **Chlorphenamine maleate (Non-proprietary)**
  - Chlorphenamine maleate 10 mg per 1 ml
  - Chlorphenamine 10mg/1ml solution for injection ampoules | 5 ampoule (PO) | £22.48-
  - £22.50 DT price | £22.50

- **Allerief (Orbis Consumer Products Ltd)**
  - Chlorphenamine maleate 400 microgram per 1 ml
  - Allerief 2mg/5ml oral solution sugar-free | 150 ml | £2.22 DT price | £2.62

- **Piriton (GlaxoSmithKline Consumer Healthcare)**
  - Chlorphenamine maleate 400 microgram per 1 ml
  - Piriton 2mg/5ml syrup | 150 ml | £2.78 DT price | £2.62
**INDICATIONS AND DOSE**

**Pruritus**
- **BY MOUTH**
  - Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight

**SIDE-EFFECTS**
- Frequency not known: Anxiety, dyskinesia (after stopping use)
- Common or very common: Gastrointestinal problems, drowsiness, hypotension, excitability, tremor in the neonate
- Uncommon: Priapism, palpitation, tremor (with high doses)
- Rare: blurred vision, urinary retention, ventricular arrhythmias, vertigo, vomiting

**MEDICINAL FORMS**
- Hydroxyzine hydrochloride 25 mg tablets
- Hydroxyzine hydrochloride 50 mg tablets
- Atarax (Alliance Pharmaceuticals Ltd)
  - Hydroxyzine hydrochloride 10 mg tablets | 84 tablet [P] | £1.00 DT price = £0.76
  - Hydroxyzine hydrochloride 25 mg tablets | 28 tablet [P] | £0.62 DT price = £0.62

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- QT interval prolongation: Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.
- **CAUTIONS**
  - Bladder outflow obstruction: breathing problems, cardiovascular disease, children, decreased gastrointestinal motility, dementia, epilepsy, hypertension, hyperthyroidism, myasthenia gravis, pyloroduodenal obstruction: stenosing peptic ulcer: susceptibility to angle-closure glaucoma: urinary retention
- **CAUTIONS, FURTHER INFORMATION**
  - Children have an increased susceptibility to side-effects, particularly CNS effects.
  - **INTERACTIONS**
    - Appendix 1: antihistamines (sedating)
  - **SIDE-EFFECTS**
    - Common or very common: Dry mouth, fatigue, headache
    - Uncommon: Constipation: dizziness: insomnia: nausea
    - Rare: Blood disorders: bronchospasm: liver dysfunction: rashes

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de points; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.

To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:
- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Consider the risks of QT-interval prolongation and torsade de points before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- The lowest effective dose for the shortest period of time should be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**UNLICENSED USE**

Ucerax® preparations not licensed for use in children under 1 year.

**INDICATIONS AND DOSE**

**Pruritus**
- **BY MOUTH**
  - Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight

**SIDE-EFFECTS**
- Frequency not known: Anxiety, dyskinesia (after stopping use)
- Common or very common: Gastrointestinal problems, drowsiness, hypotension, excitability, tremor in the neonate
- Uncommon: Priapism, palpitation, tremor (with high doses)
- Rare: Blurred vision, urinary retention, ventricular arrhythmias, vertigo, vomiting

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**UNLICENSED USE**

Ucerax® preparations not licensed for use in children under 1 year.

**Ketotifen**

**INDICATIONS AND DOSE**

**Allergic rhinitis**
- By mouth
- Child 3–17 years: 1 mg twice daily

**CONTRA-INDICATIONS** Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe) · neonate (due to significant antimuscarinic activity)

**CAUTIONS** Epilepsy · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention

**INTERACTIONS** → Appendix 1: antihistamines (sedating)

**SIDE-EFFECTS**
- Common or very common Irritability · nervousness
- Uncommon Cystitis
- Rare Weight gain
- Very rare Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**
Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **Cautionary and advisory labels** 2, 21
- **Ketotifen (as Ketotifen fumarate) 200 microgram per 1 ml** Zaditen 1mg/5ml elixir sugar-free | 300 ml Pot £8.91 DT price = £8.91

**Tablet**
- **Cautionary and advisory labels** 2, 21
- **Zaditen (CD Pharma AB)**
  - **Ketotifen (as Ketotifen fumarate) 1 mg** Zaditen 1mg tablets | 60 tablet Pot £7.53

**Promethazine hydrochloride**

**INDICATIONS AND DOSE**

**Symptomatic relief of allergy such as hay fever and urticaria** | Insomnia associated with urticaria and pruritus
- By mouth
- Child 2–4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
- Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
- Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily

**Sedation (short-term use)**
- By mouth
- Child 2–4 years: 15–20 mg
- Child 5–9 years: 20–25 mg
- Child 10–17 years: 25–50 mg

**Sedation in intensive care**
- By mouth, or by slow intravenous injection, or by deep intramuscular injection
- Child 1 month–11 years: 0.5–1 mg/kg 4 times a day (max. per dose 25 mg), adjusted according to response
- Child 12–17 years: 25–50 mg 4 times a day, adjusted according to response

**Nausea** | **Vomiting** | **Vertigo** | **Labyrinthine disorders** | **Motion sickness**
- By mouth
- Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 10–17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

**UNLICENSED USE** Not licensed for use for sedation in children under 2 years.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM advice (March 2008 and February 2009) over-the-counter cough and cold medicines for children**
Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

**CONTRA-INDICATIONS** Many antihistamines should be avoided in acute porphyrias p. 577 but promethazine is thought to be safe · neonate (due to significant antimuscarinic activity) · should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

**CAUTIONS**

**GENERAL CAUTIONS**
Epilepsy · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

**SPECIFIC CAUTIONS**
- With intravenous use Avoid extravasation with intravenous injection

**INTERACTIONS** → Appendix 1: antihistamines (sedating)

**SIDE-EFFECTS**
- Rare Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

Hypersensitivity reactions to wasp and bee venoms.

Avoid in severe liver disease.

Consult product literature for details of allergens, vial strengths, and administration.

Each set of allergy extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

NICE technology appraisals (TAs)

Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

www.nice.org.uk/TA246

VACCINES > ALLERGEN-TYPE VACCINES

Bee venom extract

Indications and dose

Hypersensitivity to bee venom

- By Subcutaneous injection
- Child: (consult product literature)

Important safety information

Desensitising vaccines

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- Hypersensitivity to wasp and bee venom.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

Contra-indications

Children under 5 years: consult product literature

Cautions

Consult product literature

Interactions

Appendix 1: bee venom extract

Side-effects

Further information

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

Propofol specific information

Dental practitioners’ formulary

Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

Less suitable for prescribing

Promethazine is less suitable for prescribing for sedation.

Exceptions to legal category

Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

Excipients: May contain Sulfites

- Phenergan (Sanofi)
  - Promethazine hydrochloride 25 mg per 1 ml Phenergan 25mg/1ml solution for injection ampoules 10 ampoule £6.74

Oral solution

- Promethazine hydrochloride 25 mg Phenergan 25mg tablets | 56 tablet £4.65 DT price = £4.65

- Sominex (Teva UK Ltd)
  - Promethazine hydrochloride 20 mg Sominex 20mg tablets | 8 tablet £1.89 | 16 tablet £2.69

Pharmalgen Bee Venom 120 nanogram

Pharmalgen® Bee Venom 120 nanogram powder and solvent for solution for injection vials 1 vial no price available
Grass pollen extract

**INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

- **BY SUBCUTANEOUS INJECTION**
  - Child: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

- **BY MOUTH**
  - Child 5–17 years: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

**IMPORTANT SAFETY INFORMATION**

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS**

Children under 5 years - consult product literature

**CAUTIONS**

Consult product literature

**INTERACTIONS**

Appendix 1: grass pollen extract

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Consult product literature.

- Hypersensitivity reactions. Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have **resolved completely**.

- **PREGNANCY**
  - Should be avoided in pregnant women—consult product literature.

- **MONITORING REQUIREMENTS**
  - The first dose of grass pollen extract should be (**Grazax®**) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **DIRECTIONS FOR ADMINISTRATION**
  - Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

**PATIENT AND CARER ADVICE**

- With oral use. Patients or carers should be given advice on how to administer oral lyophilisates.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Pharmalgen® for bee and wasp venom allergy (February 2012) NICE TA246

Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:
- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

**Other drugs used for Angioedema**
Adrenaline/epinephrine p. 132

**DRUGS USED IN HEREDITARY ANGIOEDEMA**

**COMPLEMENT REGULATORY PROTEINS**

**C1-esterase inhibitor**

**INDICATIONS AND DOSE**

**BERINERT®**

- Acute attacks of hereditary angioedema (under expert supervision)
  - By slow intravenous injection, or by intravenous infusion
  - Child: 20 units/kg

- Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
  - By slow intravenous injection, or by intravenous infusion
  - Child: 15–30 units/kg (max. per dose 1000 units) for 1 dose, to be administered less than 6 hours before procedure

**CINRYZE®**

- Acute attacks of hereditary angioedema (under expert supervision)
  - By slow intravenous injection
  - Child 12–17 years: 1000 units for 1 dose, may be repeated if necessary

- Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
  - By slow intravenous injection
  - Child 12–17 years: 1000 units for 1 dose, to be administered up to 24 hours before procedure

- Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)
  - By slow intravenous injection
  - Child 12–17 years: 1000 units every 3–4 days, interval between doses to be adjusted according to response
Dornase alfa is a genetically engineered version of a naturally occurring human deoxyribonuclease 1 (rhDNase).

**DRUG ACTION**
Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

**INDICATIONS AND DOSE**
Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

- **BY INHALATION OF NEBULISED SOLUTION**
- **Child 5-17 years**: 2500 units once daily, administered by jet nebuliser

**DOSE EQUIVALENCE AND CONVERSION**
Dornase alfa 1000 units is equivalent to 1 mg

**SIDE-EFFECTS**
- **Rare** Chest pain, conjunctivitis, dyspepsia, dysphonia, dyspnorea, laryngitis, pharyngitis, pyrexia, rash, rhinitis, urticaria

**PREGNANCY**
No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Amount probably too small to be harmful—manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION**
Dornase alfa is administered by inhalation using a jet nebuliser, usually

### Conditions affecting sputum viscosity

#### Mucolytics for cystic fibrosis

**Overview**
Mucolytics, such as carbocisteine below are used to facilitate mucociliary clearance and expectoration by reducing sputum viscosity but evidence of efficacy is limited.

Dornase alfa below is used to reduce sputum viscosity in children with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mucolytics such as carbocisteine below are used to facilitate mucociliary clearance and expectoration by reducing sputum viscosity but evidence of efficacy is limited.

### Carbocisteine

**INDICATIONS AND DOSE**
Reduction of sputum viscosity

- **BY MOUTH**
  - Child 2–4 years: 62.5–125 mg 4 times a day
  - Child 5–11 years: 250 mg 3 times a day
  - Child 12–17 years: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

**SIDE-EFFECTS**
- **Rare** Chest pain, conjunctivitis, dyspepsia, dysphonia, dyspnorea, laryngitis, pharyngitis, pyrexia, rash, rhinitis, urticaria

**PREGNANCY**
No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Amount probably too small to be harmful—manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION**
Dornase alfa is administered by inhalation using a jet nebuliser, usually

---

### Important Safety Information

*Mucodyne Paediatric*® syrup 250 mg/5 mL has replaced the 125 mg/5 mL formulation—take care to ensure the appropriate dose is administered.

**CONTRA-INDICATIONS**
Active peptic ulceration

**CAUTIONS**
History of peptic ulceration (may disrupt the gastric mucosal barrier)

**SIDE-EFFECTS**
- **Rare** Gastro-intestinal bleeding
- **Frequency not known** Erythema multiforme - Stevens-Johnson syndrome

**PREGNANCY**
Manufacturer advises avoid in first trimester.

**BREAST FEEDING**
No information available.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

---

Ivacaftor

22-Mar-2017

INDICATIONS AND DOSE
Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

BY MOUTH
Child 6-17 years: 150 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.

CONTRA-INDICATIONS Organ transplantation (no information available)
INTERACTIONS ➔ Appendix 1: ivacaftor
SIDE-EFFECTS
Common or very common Abdominal pain • diarrhoea • dizziness • ear discomfort • headache • nasal congestion • nasopharyngitis • oropharyngeal pain • pharyngeal erythema • pharyngeal oedema • rash • rhinitis • tinnitus • upper respiratory-tract infection
Uncommon Gynaecomastia • nipple disorders • vestibular disorder
PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—no information available.
HEPATIC IMPAIRMENT Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.
RENAL IMPAIRMENT Caution in severe impairment.
PRE-TREATMENT SCREENING If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.
MONITORING REQUIREMENTS
Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).

Lumacaftor with ivacaftor

22-Nov-2016

INDICATIONS AND DOSE
Treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

BY MOUTH
Child 12-17 years: 400/250 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.

DOSE EQUIVALENT AND CONVERSION
Dose expressed as x/y mg of lumacaftor/ivacaftor.

CAUTIONS Forced expiratory volume in 1 second (FEV1) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment—pulmonary exacerbation—no information available
INTERACTIONS ➔ Appendix 1: ivacaftor, lumacaftor
SIDE-EFFECTS
Common or very common Dyspnoea • elevated transaminases (clinically significant) • flatulence • menstrual disturbances • metrorrhagia • nausea • rhinorrhea • vomiting
Uncommon Cholestatic hepatitis • hepatic encephalopathy • hypertension
BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
HEPATIC IMPAIRMENT Manufacturer advises reduce dose to 400/250 mg in the morning and 200/125 mg in the evening (600/375 mg total daily dose) in moderate impairment; reduce dose to 200/125 mg every 12 hours (400/250 mg total daily dose) in severe impairment. Manufacturer advises use with caution in severe impairment.
PRE-TREATMENT SCREENING If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.
Cough and congestion

4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used to relieve congestion and ease breathing. Although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting. Boiling water should not be used owing to the risk of scalding.

Strong aromatic decongestants (applied as rubs or to pillows) are not recommended for infants under the age of 3 months. Sodium chloride 0.9% solution p. 561 given as nasal drops can be used to liquefy mucous secretions and relieve nasal congestion in infants and young children; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations

Cough suppressants

Cough may be a symptom of an underlying disorder such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be associated with smoking or environmental pollutants. Cough can also result from bronchiectasis including that associated with cystic fibrosis; cough can also have a significant habit component. There is little evidence of any significant benefit from the use of cough suppressants in children with acute cough in ambulatory settings. Cough suppressants may cause sputum retention and this can be harmful in children with bronchiectasis.

The use of cough suppressants containing pholcodine p. 181 or similar opioid analgesics is not generally recommended in children and should be avoided in children under 6 years; the use of over-the-counter cough suppressants containing codeine phosphate p. 265 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Demulcent and expectorant cough preparations

Simple lintus and other demulcent cough preparations containing soothing substances, such as syrup or glycerol, may temporarily relieve a dry irritating cough. These preparations have the advantage of being harmless and inexpensive and sugar-free versions are available.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound cough preparations for children are on sale to the public but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 172,
- diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine hydrochloride p. 121, pseudoephedrine hydrochloride p. 667, ephedrine hydrochloride p. 120, oxymetazoline, or xylometazoline hydrochloride p. 667 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

Systemic nasal decongestants

Nasal congestion in children due to allergic or vasomotor rhinitis should be treated with oral antihistamines, topical nasal preparations containing corticosteroids, or topical decongestants.

There is little evidence to support the use of systemic decongestants in children.

Pseudoephedrine hydrochloride has few sympathomimetic effects, and is commonly combined with other ingredients (including antihistamines) in preparations intended for the relief of cough and cold symptoms.
**Pholcodine**

**INDICATIONS AND DOSE**

**Dry cough**
- Child 6–11 years: 2–5 mg 3–4 times a day
- Child 12–17 years: 5–10 mg 3–4 times a day

**CONTRA-INDICATIONS**
- Bronchiectasis, bronchiolitis, chronic bronchitis, patients at risk of respiratory failure
- Asthma, chronic cough, persistent cough, productive cough

**CAUTIONS**
- There can be variation in the licensing of different medicines containing the same drug.

**INTERACTIONS**
- Appendix 1: pholcodine

**SIDE-EFFECTS**
- Confusion, constipation, dizziness, drowsiness, excitement, nausea, rash, sputum retention, vomiting

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**
- Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**HEPATIC IMPAIRMENT**
- Avoid in hepatic impairment.

**RENAL IMPAIRMENT**
- Use with caution in renal impairment. Avoid in severe renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include anise.
- There can be variation in the licensing of different medicines containing the same drug.

**MEdICINAL FORMS**
- There are variations of the same drug.
- There can be variation in the licensing of different medicines containing the same drug.

**Eucalyptus with menthol**

**INDICATIONS AND DOSE**

**Aromatic inhalation for relief of nasal congestion**
- **BY INHALATION**
- Child: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour

**PRESCRIBING AND DISPENSING INFORMATION**
- When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol or levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL.
- Not recommended (applied as a rub or to pillows) for infants under the age of 3 months.

**MEDICAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants

Respiratory stimulants (anaesthetic drugs), such as caffeine citrate p. 183, reduce the frequency of neonatal apnoea, and the need for mechanical ventilation during the first 7 days of treatment. They are typically used in the management of very preterm neonates, and continued until a corrected gestational age of 34 to 35 weeks is reached (or longer if necessary). They should only be given under expert supervision in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, beractant below and poractant alfa below are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than rescue treatment in preterm neonates of 29 weeks or less corrected gestational age. Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection. Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks corrected gestational age. Betamethasone p. 418 given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

Pulmonary surfactants

Beractant

- **INDICATIONS AND DOSE**
  Treatment of respiratory distress syndrome in preterm neonates, birth-weight over 700 g (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Preterm neonate: 100 mg/kg, preferably administer within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

  Prophylaxis of respiratory distress syndrome in preterm neonates (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate up to 32 weeks corrected gestational age: 100 mg/kg, preferably administer within 15 minutes of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

  DOSE EQUIVALENCE AND CONVERSION
  - Phospholipid 100 mg/kg is equivalent to a volume of 4 mL/kg.

  - **CAUTIONS** Consult product literature
  - **SIDE-EFFECTS**
    - Rare Bradycardia · decreased oxygen saturation · pulmonary haemorrhage
    - Frequency not known Hyperoxia · intracranial haemorrhage · obstruction of the endotracheal tube by mucous secretions

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Liquid**
      - Beractant
        - Survanta (AbbVie Ltd)
        - Phospholipids as Beractant 25 mg per 1 ml Survanta 200mg/8ml endotracheopulmonary suspension bottles | 1 bottle [Pres] £306.43

Poractant alfa

- **INDICATIONS AND DOSE**
  Treatment of respiratory distress syndrome in neonates, birth weight over 700 g (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate: 100–200 mg/kg, then 100 mg/kg every 12 hours if required, maximum 300–400 mg/kg per course.

  Prophylaxis of respiratory distress syndrome (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate 24 weeks to 31 weeks corrected gestational age: 100–200 mg/kg, administer soon after birth, preferably within 15 minutes, then 100 mg/kg after 6–12 hours if required, then 100 mg/kg after 12 hours if required, and if neonate still intubated. Max 300–400 mg/kg per course.

  - **CAUTIONS** Consult product literature
  - **SIDE-EFFECTS**
    - Rare Bradycardia · decreased oxygen saturation · hypotension · pulmonary haemorrhage
    - Frequency not known Hyperoxia · intracranial haemorrhage · obstruction of the endotracheal tube by mucous secretions

Respiratory stimulants

Respiratory stimulants

Respiratory stimulants (anaesthetic drugs), such as caffeine citrate p. 183, reduce the frequency of neonatal apnoea, and the need for mechanical ventilation during the first 7 days of treatment. They are typically used in the management of very preterm neonates, and continued until a corrected gestational age of 34 to 35 weeks is reached (or longer if necessary). They should only be given under expert supervision in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, beractant below and poractant alfa below are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than rescue treatment in preterm neonates of 29 weeks or less corrected gestational age. Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection. Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks corrected gestational age. Betamethasone p. 418 given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

Pulmonary surfactants

Beractant

- **INDICATIONS AND DOSE**
  Treatment of respiratory distress syndrome in preterm neonates, birth-weight over 700 g (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Preterm neonate: 100 mg/kg, preferably administer within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

  Prophylaxis of respiratory distress syndrome in preterm neonates (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate up to 32 weeks corrected gestational age: 100 mg/kg, preferably administer within 15 minutes of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

  DOSE EQUIVALENCE AND CONVERSION
  - Phospholipid 100 mg/kg is equivalent to a volume of 4 mL/kg.

  - **CAUTIONS** Consult product literature
  - **SIDE-EFFECTS**
    - Rare Bradycardia · decreased oxygen saturation · pulmonary haemorrhage
    - Frequency not known Hyperoxia · intracranial haemorrhage · obstruction of the endotracheal tube by mucous secretions

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Liquid**
      - Beractant
        - Survanta (AbbVie Ltd)
        - Phospholipids as Beractant 25 mg per 1 ml Survanta 200mg/8ml endotracheopulmonary suspension bottles | 1 bottle [Pres] £306.43

Poractant alfa

- **INDICATIONS AND DOSE**
  Treatment of respiratory distress syndrome in neonates, birth weight over 700 g (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate: 100–200 mg/kg, then 100 mg/kg every 12 hours if required, maximum 300–400 mg/kg per course.

  Prophylaxis of respiratory distress syndrome (specialist use only)
  - **BY ENDOTRACHEAL TUBE**
    - Neonate 24 weeks to 31 weeks corrected gestational age: 100–200 mg/kg, administer soon after birth, preferably within 15 minutes, then 100 mg/kg after 6–12 hours if required, then 100 mg/kg after 12 hours if required, and if neonate still intubated. Max 300–400 mg/kg per course.

  - **CAUTIONS** Consult product literature
  - **SIDE-EFFECTS**
    - Rare Bradycardia · decreased oxygen saturation · hypotension · pulmonary haemorrhage
    - Frequency not known Hyperoxia · intracranial haemorrhage · obstruction of the endotracheal tube by mucous secretions

## 5.1 Neonatal apnoea

### XANTHINES

#### Caffeine citrate

**24-Feb-2016**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **Curosurf** (Chiesi Ltd)
  - Phospholipids (as Poractant alfa) 80 mg per 1 ml
  - Curosurf 240mg/3ml endotracheopulmonary suspension vials | 1 vial (£547.40) (Hospital only)
  - Curosurf 120mg/1.5ml endotracheopulmonary suspension vials | 1 vial (£81.64) (Hospital only)

**INDICATIONS AND DOSE**

**Neonatal apnoea (specialist supervision in hospital)**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Neonate: Initially 20 mg/kg, administered over 30 minutes if given by intravenous infusion, then 5 mg/kg once daily, administered over 10 minutes if given by intravenous infusion, started 24 hours after initial dose; increased if necessary to 10 mg/kg daily.

**DOSAGE EQUIVALENCE AND CONVERSION**

- Caffeine citrate 2 mg = caffeine base 1 mg

**PHARMACOKINETICS**

Caffeine citrate is well absorbed when given orally.

**UNLICENSED USE**

[Caffeine citrate loading doses in the BNFC 2017-2018 may differ to those in product literature.](http://www.bnf.org)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SAFE PRACTICE**

From August 2013, all licensed preparations of caffeine are required to be labelled as caffeine citrate. To minimise the risk of dosing errors, always state dose in terms of caffeine citrate when prescribing caffeine. Some stock packaged as caffeine base.

**CAUTIONS**

Cardiovascular disease, gastro-oesophageal reflux, rhythm disorder, seizure disorders

**INTERACTIONS**

[Appendix 1: caffeine citrate](http://www.bnf.org)

**SIDE-EFFECTS**

- **Common or very common** Fluid and electrolyte imbalance, hyperglycaemia, hypertension, hypoglycaemia, irritability, restlessness, tachycardia

- **Frequency not known** Gastro-oesophageal reflux

**HEPATIC IMPAIRMENT**

Manufacturer advises caution with impaired hepatic function.

**RENAL IMPAIRMENT**

Reduced daily maintenance dose required—consult product literature. Manufacturer advises caution with impaired renal function—potential for accumulation of caffeine.

**MONITORING REQUIREMENTS**

[Caffeine citrate loading doses in the BNFC 2017-2018 may differ to those in product literature.](http://www.bnf.org)

- Monitor for recurrence for apnoea for 1 week after stopping treatment.

**DIRECTIONS FOR ADMINISTRATION**

Caffeine citrate injection may be administered by mouth or by intravenous infusion.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (September 2013) that Peyona® is accepted for use within NHS Scotland for the treatment of primary apnoea of premature newborns only whilst Peyona® is available at the price agreed in the patient access scheme.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **Caffeine citrate (Non-proprietary)**
  - Caffeine citrate 10 mg per 1 ml
  - Caffeine citrate 10mg/1ml solution for injection ampoules | 10 ampoule (£48.82)

**Solution for infusion**

- **Peyona** (Chiesi Ltd)
  - Caffeine citrate 20 mg per 1 ml
  - Peyona 20mg/ml solution for infusion ampoules | 10 ampoule (£172.50) (Hospital only)

**Oral solution**

- **Caffeine citrate (Non-proprietary)**
  - Caffeine citrate 10 mg per 1 ml
  - Caffeine citrate 50mg/5ml oral solution | 5 ml (£24.41-£25.85 DT price = £25.13)

**Solution for infusion**

- **Peyona** (Chiesi Ltd)
  - Caffeine citrate 20 mg per 1 ml
  - Peyona 20mg/ml solution for infusion ampoules | 10 ampoule (£172.50) (Hospital only)

**BNFC 2017-2018**

**Neonatal apnoea**

**183**

1  Epilepsy and other seizure disorders

Epilepsy

Control of the epilepsies

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The frequency of administration is often determined by the plasma–drug half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, when used in usual dosage, can be given twice daily. Lamotrigine p. 203, perampanel p. 197, phenobarbital p. 208 and phenytoin p. 198, which have long half-lives, can be given as a daily dose at bedtime. However, with large doses, some antiepileptics may need to be given three times daily to avoid adverse effects associated with high peak plasma-drug concentrations. Young children metabolise some antiepileptics more rapidly than adults and therefore may require more frequent doses and a higher amount per kilogram body-weight.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible and will achieve seizure control for the majority of children.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.
**Category 1**
Phenytoin, carbamazepine p. 189, phenobarbital, primidone p. 209. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product.

**Category 2**
Valproate, lamotrigine, perampanel, rufinamide, clobazam p. 210, clonazepam p. 211, oxcarbazepine p. 197, eslicarbazepine acetate, zonisamide p. 207, topiramate p. 204. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

**Category 3**
Levetiracetam p. 196, lacosamide p. 193, tiagabine p. 203, gabapentin p. 192, pregabalin, ethosuximide p. 191, vigabatrin p. 206. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors.

**Antiepileptic hypersensitivity syndrome**
Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide p. 200); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine acetate, stiripentol p. 203, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the child should not be re-exposed, and expert advice should be sought.

**Risk of suicidal thoughts and behaviour**
The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Children and their parents or carers should be advised to seek medical advice if the child develops any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

**Interactions**
Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**
Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free child, and its timing, is often difficult and depends on individual circumstances. Even in children who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

In children receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Monitoring**
Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma-drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Plasma concentration of some medications may change during pregnancy and monitoring may be required (see under Pregnancy).

**Driving**
If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA).

Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Patients who have had a seizure while asleep are not permitted to drive for one year from the date of each seizure unless:

- a history or pattern of sleep seizures occurring only ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

**Pregnancy**
Young women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term developmental disorders. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Young women of child-bearing potential
who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Young women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 50%. The risk of harm to the mother and fetus from convulsive seizures is of the same order as the risk to the mother and fetus from convulsive seizures while seizures are untreated. Women who do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folic acid supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 200 and valproic acid p. 205 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital, and can take several days to diminish.

**Epilepsy and Pregnancy Register**

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

**Breast-feeding**

Young women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

**Focal seizures with or without secondary generalisation**

Carbamazepine p. 189 and lamotrigine p. 203 are the drugs of choice for focal seizures; levetiracetam p. 196, oxcarbazepine p. 197 and sodium valproate p. 200 can be considered if these are unsuitable. These drugs may also be used as adjunctive treatment. Other adjunctive options include clobazam p. 210, gabapentin p. 192, and topiramate p. 204. If adjunctive treatment is ineffective or not tolerated, a tertiary specialist should be consulted who may consider eslicarbazepine acetate, lacosamide p. 193, phenobarbital p. 208, phenytoin p. 198, pregabalin, tiagabine p. 203, vigabatrin p. 206, and zonisamide p. 207.

**Generalised seizures**

**Tonic-clonic seizures**

The drug of choice for newly diagnosed tonic-clonic seizures in children is sodium valproate (except in female patients, see *Valproate* below); lamotrigine where sodium valproate is unsuitable (but may exacerbate myoclonic seizures). In children with established epilepsy with generalised tonic-clonic seizures only, lamotrigine may be prescribed as the first-line choice. Carbamazepine or oxcarbazepine can also be considered but may exacerbate myoclonic or absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate, or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

**Absence seizures**

Ethosuximide p. 191 and sodium valproate (except in female patients, see *Valproate* below) are the drugs of choice for absence seizures and syndromes; lamotrigine can be used if these are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Second-line therapy includes clobazam, clonazepam p. 211, levetiracetam, topiramate or zonisamide which may be considered by a tertiary specialist if adjunctive treatment fails. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended in absence seizures or syndromes.

**Myoclonic seizures**

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice (except in female patients, see *Valproate* below); carbamazepine, oxcarbazepine, phenytoin, pregabalin, tiagabine p. 203, vigabatrin p. 206, and zonisamide p. 207.
Epilepsy syndromes

Infantile spasms

Vigabatrin is the drug of choice for infantile spasms associated with tuberous sclerosis. Corticosteroids, such as prednisolone p. 421 or tetracosactide p. 452, are second-line options if vigabatrin is ineffective. In spasms of other causes, vigabatrin, prednisolone or tetracosactide can be considered as first-line options. A tertiary specialist should be consulted before treating infantile spasms.

Dravet syndrome

Sodium valproate (except in female patients, see Valproate below) or topiramate is the treatment of choice in Dravet syndrome. Clorazam or stiripentol p. 203 may be considered as adjunctive treatment. Carbamazepine, gabapentin, lamotrigine, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin should not be used as they may exacerbate myoclonic seizures. A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome.

Lennox-Gastaut syndrome

Sodium valproate is the first-line drug for treating Lennox-Gastaut syndrome (except in female patients, see Valproate below); lamotrigine can be used as adjunctive treatment if sodium valproate is ineffective or not tolerated. Rufinamide and topiramate may be considered by tertiary epilepsy specialists. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used. Felbamate [unlicensed] may be used in tertiary specialist centres when all other treatment options have failed.

Landau-Kleffner syndrome

Always discuss with or refer to tertiary epilepsy specialists.

Neonatal seizures

Seizures can occur before delivery, but they are most common up to 24 hours after birth. Seizures in neonates occur as a result of biochemical disturbances, inborn errors of metabolism, hypoxic ischaemic encephalopathy, drug withdrawal, meningitis, stroke, cerebral haemorrhage or malformation, or severe jaundice (kermiticus).

Seizures caused by biochemical imbalance and those in neonates with inherited abnormal pyridoxine or biotin metabolism should be corrected by treating the underlying cause. Seizures caused by drug withdrawal following intrauterine exposure are treated with a drug withdrawal regimen.

Phenobarbital can be used to manage neonatal seizures where there is a risk of recurrence; phenytoin is an alternative. Midazolam p. 215 and rectal paraldehyde p. 215 may also be useful in the management of acute neonatal seizures. Lidocaine hydrochloride p. 796 may be used if other treatments are unsuccessful; lidocaine hydrochloride should not be given to neonates who have received phenytoin infusion because of the risk of cardiac toxicity.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly in small increments every 3–7 days. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

 Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Ethosuximide

Ethosuximide is a first-line treatment option for absence seizures, and may be used as adjunctive treatment when monotherapy has failed.

Gabapentin

Gabapentin p. 192 is used as adjunctive therapy for the treatment of focal seizures with or without secondary generalisation; it is licensed as monotherapy in children over 12 years. It is not recommended if tonic, atonic, absence or myoclonic seizures are present.

Lamotrigine

Lamotrigine p. 203 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed as monotherapy for typical absence seizures in children (but efficacy may not be maintained in all children).

Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam and brivaracetam

Levetiracetam p. 196 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in children with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 188 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

Phenobarbital and primidone

Phenobarbital p. 208 is effective for tonic-clonic, focal seizures and neonatal seizures but may cause behavioural disturbances and hyperkinesia. It may be tried for atypical absence, atonic, and tonic seizures. For therapeutic purposes phenobarbital and phenobarbital sodium should be considered equivalent in effect. Rebound seizures may be a problem on withdrawal.

Primidone p. 209 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. It is used rarely in children. A low initial dose of primidone is essential.

Phenytoin

Phenytoin p. 198 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 191, a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin should be given intravenously only, fosphenytoin sodium may also be given by intramuscular injection.
Rufinamide
Rufinamide p. 200 is licensed for the adjunctive treatment of seizures in Lennox–Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate
Topiramate p. 204 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures. It can also be used for absence, tonic and atonic seizures under specialist supervision and as an option in myoclonic seizures [all unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

Valproate
Valproate (as either sodium valproate p. 200 or valproic acid p. 205) is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Valproate should generally be avoided in children under 2 years especially with other antiepileptics, but it may be required in infants with continuing epileptic tendency. Sodium valproate has widespread metabolic effects, and monitoring of liver function tests and full blood count is essential. Valproate should not be used in female children, in females of childbearing potential, and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and risks of valproate therapy should be carefully reconsidered at regular treatment reviews, see Important safety information in the sodium valproate and valproic acid drug monographs. Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Zonisamide
Zonisamide p. 207 can be used as an adjunctive treatment for refractory focal seizures with or without secondary generalisation in children and adolescents aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 210 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 211 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 655, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstuation. Piraacetam is used as adjunctive treatment for cortical myoclonus.

Status epilepticus

Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the child to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Pyridoxine hydrochloride p. 600 should be administered if the status epilepticus is caused by pyridoxine deficiency.

Seizures lasting 5 minutes should be treated urgently with buccal midazolam p. 215 or intravenous lorazepam p. 214 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 212 is effective but it carries a high risk of venous thrombophlebitis (reduced by using an emulsion formulation of diazepam injection).

Patients should be monitored for respiratory depression and hypotension.

Important
If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium should be used, or if the child is on regular phenytoin, give phenobarbital sodium intravenously over 5 minutes; the paediatric intensive care unit should be contacted. Paraldehyde p. 215 can be given after starting phenytoin infusion.

If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 214 should be instituted with full intensive care support.

Phenytoin sodium can be given by intravenous infusion over 20 minutes, followed by the maintenance dosage if appropriate.

Paraldehyde given rectally causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

Non-convulsive status epilepticus
The urgency to treat non-convulsive status epilepticus depends on the severity of the child’s condition. If there is incomplete loss of awareness, oral antiepileptic therapy should be continued or restarted. Children who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febriile convulsions
Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 260), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), or recurrent febrile convulsions without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

ANTIEPILEPTICS

Brivaracetam

- **INDICATIONS AND DOSE**
  - Adjunctive therapy of partial-onset seizures with or without secondary generalisation

- **SIDE-EFFECTS**
  - Common or very common Anxiety · constipation · decreased appetite · depression · dizziness · insomnia · irritability · malaise · nausea · somnolence · vertigo · vomiting
  - Uncommon Aggression · agitation · neutropenia · psychotic disorder · suicidal ideation
  - Pregnancy Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.
  - Breast Feeding Manufacturer advises avoid—present in milk in animal studies.
  - Hepatic Impairment Manufacturer advises consider a starting dose of 25 mg twice daily in chronic liver disease; max. maintenance dose 75 mg twice daily in all stages of impairment.
  - Treatment Cessation Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.
Carbamazepine

INDICATIONS AND DOSE

Trigeminal neuralgia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily

Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Prophylaxis of bipolar disorder

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily

Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Focal and generalised tonic-clonic seizures

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily

Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

BY RECTUM

Child: Up to 250 mg up to 4 times a day, to be used for short-term use (max. 7 days) when oral therapy temporarily not possible, use approx. 25% more than the oral dose

DOSE EQUIVALENT AND CONVERSION

Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN® SR

Epilepsy and other seizure disorders 189
1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses

- Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

- BY MOUTH
  - Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 400 mg/kg daily in 2 divided doses
  - Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses

Trigeminal neuralgia

- BY MOUTH
  - Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
  - Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly

CONTRA-INDICATIONS

Acute porphyrias p. 577

CAUTIONS

Cardiac disease | history of haematological reactions to other drugs | may exacerbate absence and myoclonic seizures | skin reactions | susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- Blood, hepatic, or skin disorders
  - Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopoenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

INTERACTIONS

Appendix 1: antiepileptics

SIDE-EFFECTS

Common or very common
- Allergic skin reactions | aplastic anaemia | ataxia | blood disorders | blurring of vision | dermatitis | dizziness | dry mouth | eosinophilia | fatigue | haemolytic anaemia | headache | hypotension | jaundice | lymph node enlargement | muscle weakness | paraesthesia | peripheral neuropathy | restlessness | systemic lupus erythematosus | vanishing bile duct syndrome

Rare
- Abdominal pain | aggression | agitation | anorexia | cardiac conduction disorders | confusion | delayed multi-organ hypersensitivity disorder | depression | dysarthria | hallucinations | hepatitis | hypertension | hypotension | anorexia | cardiac conduction disorders | confusion | delayed multi-organ hypersensitivity disorder | depression | dysarthria | hallucinations | hepatitis | hypertension | hypotension | jaundice | lymph node enlargement | muscle weakness | paraesthesia | peripheral neuropathy | restlessness | systemic lupus erythematosus | vanishing bile duct syndrome

Very rare
- Arthralgia | muscle spasm | acne | alopecia | alterations in skin pigmentation | angle-closure glaucoma | aseptic meningitis | AV block with syncope | circulatory collapse | conjunctivitis | dyspnoea | exacerbation of coronary artery disease | galactorrhoea | gynaecomastia | hearing disorders | hepatic failure | hirsutism | hypercholesterolaemia | impaired male fertility | interstitial nephritis | muscle pain | neuroleptic malignant syndrome | osteomalacia | osteoporosis | pancreatitis | photosensitivity | pneumonia | pneumonitis | psychosis | pulmonary hypersensitivity | purpura | renal failure | sexual dysfunction | Stevens-Johnson syndrome | stomatitis | sweating | taste disturbance | thrombocytopenia | thrombophlebitis | toxic epidermal necrolysis | urinary frequency | urinary retention

Frequenct not known

Suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment. Children should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

Overdose

For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 803.

ALLERGY AND CROSS-SENSITIVITY

Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 184 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

PREGNANCY

Doses should be adjusted on the basis of plasma-drug concentration monitoring.

BREAST FEEDING

Amount probably too small to be harmful. Monitor infant for possible adverse reactions.

HEPATIC IMPAIRMENT

Metabolism impaired in advanced liver disease.

RENAL IMPAIRMENT

Use with caution.

PRE-TREATMENT SCREENING

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

MONITORING REQUIREMENTS

- Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
- Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

TREATMENT CESSATION

When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

DIRECTIONS FOR ADMINISTRATION

Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

TEGRETOL® PROLONGED RELEASE tablets can be halved but should not be chewed.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

Blood, hepatic, or skin disorders

Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical
attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Carbamazepine Tablets may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

**Ethinosuximide**

**INDICATIONS AND DOSE**

Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures

- **BY MOUTH**
  - Child 1 month–5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every

  - 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
  - Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily

**CAUTIONS**

- Avoid in acute porphyrias p. 577

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common**
  - Anorexia - abdominal pain - diarrhoea - gastrointestinal disturbances - nausea - vomiting - weight loss

- **Uncommon**
  - Agitation - ataxia - dizziness - drowsiness - euphoria - fatigue - headache - hiccups - impaired concentration - irritability

- **Rare**
  - Depression - dyskinesia - gingival hypertrophy - increased libido - myopia - photophobia - psychosis - rash - sleep disturbances - tongue swelling - vaginal bleeding

- **Frequency not known**
  - Agranulocytosis - aplastic anaemia - blood disorders - hyperactivity - increase in seizure frequency - leucopenia - pancytopenia - Stevens-Johnson syndrome - suicidal ideation - systemic lupus erythematosus

**SIDE-EFFETS, FURTHER INFORMATION**

- Blood disorders. Blood counts required if features of infection.

**PREGNANCY**

- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

- Present in milk. Hyperexcitability and sedation reported.

**HEPATIC IMPAIRMENT**

- Use with caution.

**RENAL IMPAIRMENT**

- Use with caution.

**PATIENT AND CARER ADVICE**

- Blood disorders. Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

**Medicines for Children leaflet: Ethosuximide for preventing seizures**

**Fosphenytoin sodium**

**DRUG ACTION**

Fosphenytoin is a pro-drug of phenytoin.
100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration.

**Prophylaxis or treatment of seizures associated with neurosurgery or head injury**
- **By intravenous infusion**
  - Child 5–17 years: Initially 10–15 mg(PE)/kg, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration.

**Temporary substitution for oral phenytoin**
- **By intravenous infusion**
  - Child 5–17 years: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute.

**DOSE EQUIVALENT AND CONVERSION**
- Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**Indications and dose**
- **By mouth**
  - Child 2–5 years: 10 mg/kg once daily on day 1, then 10 mg/kg twice daily on day 2, then 10 mg/kg 3 times a day on day 3, then increased to 30–70 mg/kg daily in 3 divided doses, adjusted according to response, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.
  - Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day.
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

**Monotherapy for focal seizures with or without secondary generalisation**
- **By mouth**
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

**Gabapentin**
- **Indications and dose**
  - Adjunctive treatment of focal seizures with or without secondary generalisation.
  - **By mouth**
  - Child 5–17 years: 10 mg(PE)/kg once daily on day 1, then 10 mg(PE)/kg twice daily on day 2, then 10 mg(PE)/kg 3 times a day on day 3, then increased to 30–70 mg(PE)/kg daily in 3 divided doses, adjusted according to response, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.
  - Child 6–11 years: 10 mg(PE)/kg once daily (max. per dose 300 mg) on day 1, then 10 mg(PE)/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg(PE)/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg(PE)/kg per day.
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

**Monotherapy for focal seizures with or without secondary generalisation**
- **By mouth**
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**Electrolytes:** May contain Phosphate
- **Pro-Epanutin (Pfizer Ltd)**
  - Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials 10 vial [po] £400.00 (Hospital only)

**BNFC 2017–2018**
response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

● **UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.

**IMPORTANT SAFETY INFORMATION**
The levels of propylene glycol, acsulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

**CAUTIONS** Diabetes mellitus • high doses of oral solution in adolescents and adults with low body-weight • history of psychotic illness • mixed seizures (including absences)

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

> **Common or very common** Abdominal pain • abnormal reflexes • abnormal thoughts • acnē • anemia • anorexia • anxiety • arthralgia • ataxia • confusion • constipation • convulsions • cough • depression • diarrhoea • dizziness • drowsiness • dry mouth • dry throat • dyspepsia • dysphonia • emotional lability • fever • flatulence • flu syndrome • gingivitis • headache • hostility • hypertension • impotence • increased appetite • insomnia • leucopenia • malaise • movement disorders • myalgia • nausea • nervousness • nystagmus • oedema • paraesthesia • pruritus • rash • rhinitis • speech disorder • tremor • twitching • vasodilatation • vertigo • visual disturbances • vomiting • weight gain

> **Uncommon** Palpitations

> **Frequency not known** Acute renal failure • alopecia • blood glucose fluctuations in patients with diabetes • breast hypertrophy • gynaecomastia • hallucinations • hepatitis • hypersensitivity syndrome • incontinence • pancreatitis • Stevens-Johnson syndrome • suicidal ideation • thrombocytopenia • tinnitus

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

**EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gabapentin for preventing seizures www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 3, 5, 8

### Lacosamide

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation

> **BY MOUTH, OR BY INTRAVENOUS INFUSION**

> Child 16–17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)

**Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)**

> **BY MOUTH, OR BY INTRAVENOUS INFUSION**

> Child 16–17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

**CONTRA-INDICATIONS** Second- or third-degree AV block

**CAUTIONS** Conduction problems • risk of PR-interval prolongation • severe cardiac disease

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

> **Common or very common** Abnormal gait • blurred vision • cognitive disorder • constipation • depression • dizziness • drowsiness • fatigue • flatulence • headache • impaired coordination • nausea • nystagmus • pruritus • tremor • vomiting

> **Rare** Multi-organ hypersensitivity reaction

> **Frequency not known** Aggression • agitation • agranulocytosis • atrial fibrillation • atrial flutter • AV block • bradycardia • confusion • dry mouth • dysarthria • dyspepsia • euphoria • hypoesthesia • irritability • muscle spasm • PR-interval prolongation • psychosis • rash • suicidal ideation • tinnitus

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 184 for more information.
PREGNANCY  The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Titrate with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.

RENAL IMPAIRMENT  Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.

CONSULT product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION  For intravenous infusion, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION  Flavours of syrup may include strawberry.

PATIENT AND CARER ADVICE  Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2009) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Vimpat (UCB Pharma Ltd)

Lacosamide 10 mg per 1 ml  Vimpat 200mg/20ml solution for infusion vials  1 vial [Pos] £29.70

Oral solution

CAUTIONARY AND ADVISORY LABELS  8

EXCIPIENTS: May contain Aspartame, propylene glycol

ELECTROLYTES: May contain Sodium

Vimpat (UCB Pharma Ltd)

Lacosamide 10 mg per 1 ml  Vimpat 10mg/ml syrup sugar-free  200 ml [Pos] £25.74 DT price = £25.74

Tablet

CAUTIONARY AND ADVISORY LABELS  8

Vimpat (UCB Pharma Ltd)

Lacosamide 50 mg Vimpat 50mg tablets  14 tablet [Pos] £10.81 DT price = £10.81

Lacosamide 100 mg Vimpat 100mg tablets  14 tablet [Pos] £21.62 | 56 tablet [Pos] £86.50 DT price = £86.50

Lacosamide 150 mg Vimpat 150mg tablets  14 tablet [Pos] £32.44 | 56 tablet [Pos] £129.74 DT price = £129.74

Lacosamide 200 mg Vimpat 200mg tablets  56 tablet [Pos] £144.16 DT price = £144.16

7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Monotherapy of typical absence seizures

BY MOUTH

Child 2–11 years: Initially 300 micrograms/kg daily in 1–2 divided doses, for 14 days, then 600 micrograms/kg daily in 1–2 divided doses, for another 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, increased if necessary up to 15 mg/kg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate

Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate

Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate

BY MOUTH

Child 2–11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Child 2–11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Child 12–17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate

Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate

Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate

BY MOUTH

Child 2–11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 5–15 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

Child 12–17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Lamotrigine

INDICATIONS AND DOSE

Monotherapy of focal seizures  Monotherapy of primary and secondary generalised tonic-clonic seizures  Monotherapy of seizures associated with Lennox-Gastaut syndrome

BY MOUTH

Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every
Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate

- BY MOUTH
  - Child 2-11 years: Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
  - Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

### IMPORTANT SAFETY INFORMATION

- **SAFE PRACTICE**
  - Do not confuse the different combinations or indications.

- **CAUTIONS**
  - Myoclonic seizures (may be exacerbated)

- **INTERACTIONS**
  - Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - Common or very common
    - Blurred vision
    - aggression
    - agitation
    - arthralgia
    - ataxia
    - back pain
    - diarrhoea
    - diplopia
    - dizziness
    - drowsiness
    - dry mouth
    - headache
    - insomnia
    - nausea
    - nystagmus
    - rash
    - tremor
    - vomiting
  - Rare
    - Conjunctivitis
  - Very rare
    - Anaemia
    - blood disorders
    - confusion
    - hallucination
    - hepatic failure
    - hypersensitivity syndrome
    - increase in seizure frequency
    - leucopenia
    - lupus erythematosus-like reactions
    - movement disorders
    - pancytopenia
    - thrombocytopenia
    - unsteadiness
  - Frequency not known
    - Aseptic meningitis
    - suicidal ideation

- **SIDE-EFFECTS, FURTHER INFORMATION**

- **Skin reactions**
  - Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 184 for more information.

- **PREGNANCY**
  - Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING**
  - Present in milk, but limited data suggest no harmful effect on infant.

- **HEPATIC IMPAIRMENT**
  - Halve dose in moderate impairment.
  - Quarter dose in severe impairment.

- **RENAL IMPAIRMENT**
  - Consider reducing maintenance dose in significant impairment. Caution in renal failure; metabolite may accumulate.

- **TREATMENT CESSATION**
  - Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

### PRESCRIBING AND DISPENSING INFORMATION

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product.

Switching between formulations
- Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

### PATIENT AND CARER ADVICE

- Skin reactions
  - Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.

- Blood disorders
  - Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

**Medicines for Children leaflet:** Lamotrigine for preventing seizures [www.medicinesforchildren.org.uk/](http://www.medicinesforchildren.org.uk/)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS 8, 13**

**Lamotrigine (Non-proprietary)**

- Lamotrigine 5 mg Lamotrigine 5mg dispersible tablets sugar free sugar-free | 28 tablet [POM] £15.00 DT price = £7.00

Levetiracetam

- **INDICATIONS AND DOSE**
  - Monotherapy of focal seizures with or without secondary generalisation
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
  - **Adjunctive therapy of focal seizures with or without secondary generalisation**
    - **BY MOUTH**
    - Child 1-5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
    - Child 6 months-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
    - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - **BY INTRAVENOUS INFUSION**
    - Child 4-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
    - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - **Adjunctive therapy of myoclonic seizures and tonic-clonic seizures**
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Child 12-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
    - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

- **UNLICENSED USE**
  - Granules not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.

- **INTERACTIONS**
  - Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · aggression · anorexia · anxiety · ataxia · convulsion · cough · depression · diarrhoea · dizziness · drowsiness · dyspepsia · headache · insomnia · irritability · malaise · nasopharyngitis · nausea · rash · tremor · vertigo · vomiting
  - Uncommon Agitation · alopecia · anemia · blurred vision · confusion · diplopia · eczema · impaired attention · leucopenia · myalgia · paraesthesia · pruritus · psychosis · suicidal ideation · thrombocytopenia · weight changes
  - Rare Agranulocytosis · choreoathetosis · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyskinesia · erythema multiforme · hepatic failure · hyponatraemia · neutropenia · pancreatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis
  - Frequency not known Completed suicide · pancytopenia

- **PREGNANCY**
  - The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

- **BREAST FEEDING**
  - Present in milk — manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- **RENAL IMPAIRMENT**
  - Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion (Keppra®), dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
  - With oral use For administration of oral solution, requisite dose may be diluted in a glass of water.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Levetiracetam for preventing seizures www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

      - Keppra (UCB Pharma Ltd)
        - Levetiracetam 100 mg per 1 ml | 10 vial | £127.31
Oxcarbazepine

- **INDICATIONS AND DOSE**

  Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures
  - **BY MOUTH**
    - Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day

  Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures
  - **BY MOUTH**
    - Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 15 mg/kg twice daily; maximum 46 mg/kg per day

  DOSE ADJUSTMENTS DUE TO INTERACTIONS

  In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

- **CAUTIONS** Avoid in acute porphyrias p. 577. Cardiac conduction disorders. Heart failure. Hynoponatraemia

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - Uncommon Leucopenia. Urticaria

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 184 for more information.

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- **MONITORING REQUIREMENTS**
  - Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
  - Monitor body-weight in patients with heart failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product. Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- **PATIENT AND CARER ADVICE**

  Blood, hepatic, or skin disorders. Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

  Medicines for children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Oral suspension**
  - **Trileptal** (Novartis Pharmaceuticals UK Ltd)
    - Oxcarbazepine 60 mg per 1 ml
      - Trileptal 60 mg/ml oral suspension sugar-free | 250 ml (Pom) £48.96 DT price = £48.96
    - Oxcarbazepine 300 mg
      - Trileptal 300 mg/ml oral suspension sugar-free | 50 tablet (Pom) £22.61 DT price = £5.89
    - Oxcarbazepine 600 mg
      - Trileptal 600 mg/ml oral suspension sugar-free | 50 tablet (Pom) £45.19 DT price = £38.76
  - **Trileptal** (Novartis Pharmaceuticals UK Ltd)
    - Oxcarbazepine 150 mg
      - Trileptal 150 mg/ml oral suspension inadequate | 50 tablet (Pom) £12.24 DT price = £8.42
    - Oxcarbazepine 300 mg
      - Trileptal 300 mg/ml oral suspension inadequate | 50 tablet (Pom) £24.48 DT price = £15.89
    - Oxcarbazepine 600 mg
      - Trileptal 600 mg/ml oral suspension inadequate | 50 tablet (Pom) £48.96 DT price = £38.76

- **Perampanel**

  - **INDICATIONS AND DOSE**

    Adjunctive treatment of focal seizures with or without secondary generalised seizures
    - **BY MOUTH**
      - Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day continued
Phenytoin

INDICATIONS AND DOSE

Tonic-clonic seizures | Focal seizures

- **BY MOUTH**
  - Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
  - Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Loading dose 18 mg/kg, dose to be administered over 20–30 minutes, then (by mouth) 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), adjusted according to response, dose also adjusted according to plasma-phenytoin concentration.

PREVENTION AND TREATMENT OF SEIZURES DURING OR FOLLOWING NEUROSURGERY OR SEVERE HEAD INJURY

- **BY MOUTH**
  - Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Titrating at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

INTERACTIONS
- Appendix 1: antiepileptics

SIDE-EFFECTS
- Aggression, anxiety, ataxia, back pain, blurred vision, changes in appetite, confusion, diplopia, dizziness, drowsiness, dysarthria, gait disturbance, irritability, malaise, nausea, suicidal behaviour, suicidal ideation, vertigo, weight increase

PREGNANCY
- Manufacturer advises avoid. The dose should be monitored while the patient is pregnant and discontinued after delivery.

BREASTFEEDING
- Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT
- Avoid in moderate or severe impairment.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations
- Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 3, 8, 25
  - Fycompa (Eisai Ltd) ▼
    - Perampanel 2 mg: Fycompa 2mg tablets | 7 tablet pack £35.00 | 28 tablet pack £140.00

Phenytoin

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
- Acute porphyrias p. 577

SPECIFIC CONTRA-INDICATIONS
- With intravenous use Second- and third-degree heart block, sino-atrial block, sinus bradycardia, Stokes-Adams syndrome

CAUTIONS

GENERAL CAUTIONS
- Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

SPECIFIC CAUTIONS
- With intravenous use Heart failure, hypotension, injection solutions alkaline (irritant to tissues), respiratory depression, resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION
- Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- Intramuscular phenytoin should not be used (absorption is slow and erratic).

INTERACTIONS
- Appendix 1: antiepileptics
SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Acne, anorexia, coarsening of facial appearance, constipation, dizziness, drowsiness, gingival hypertrophy and tenderness, maintain good oral hygiene, headache, hirsutism, insomnia, nausea, paraesthesia, rash, transient nervousness, tremor

- Rare Leucopenia, aplastic anaemia, blood disorders, dyskinesia, hepatotoxicity, lupus erythematosus, lymphadenopathy, megaloblastic anaemia, osteomalacia, peripheral neuropathy, polyarteritis nodosa, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis

- Frequency not known Hypersensitivity syndrome, interstitial nephritis, pneumonitis, polyarthropathy, suicidal ideation

SPECIFIC SIDE-EFFECTS

- Common or very common
  - With intravenous use: Alterations in respiratory function, arrhythmias, cardiovascular collapse, cardiovascular depression (particularly if injection too rapid), CNS depression (particularly if injection too rapid), hypotension, respiratory arrest
  - Frequency not known: With intravenous use, Purple glove syndrome, tonic seizures

- Sudden alterations in blood pressure, hypotension, arrhythmias

- Frequency not known: With intravenous use: Bradyarrhythmias, bradycardia, hypotension

- Overdose: Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

ALLERGY AND CROSS-SENSITIVITY

Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 184 for more information.

PREGNANCY

Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

BREAST FEEDING

Small amounts present in milk, but not known to be harmful.

HEPATIC IMPAIRMENT

Reduce dose to avoid toxicity.

PRE-TREATMENT SCREENING

HLA-DRB1 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

MONITORING REQUIREMENTS

- Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding.
- Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use: Monitor ECG and blood pressure.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.

With intravenous use: For intravenous injection, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Manufacturer advises for intravenous infusion, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Complete administration within 1 hour of preparation.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations: Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative). Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures

Rufinamide

**INDICATIONS AND DOSE**

**Adjunctive treatment of seizures in Lennox-Gastaut syndrome**

- **BY MOUTH**
  - Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 30–49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 50–69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 2.5 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

**Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate**

- **BY MOUTH**
  - Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Abdominal pain
- Acne
- Anorexia
- Anxiety
- Back pain
- Blurred vision
- Constipation
- Diarrhoea
- Diplopia
- Dizziness
- Drowsiness
- Dyspepsia
- Epistaxis
- Fatigue
- Gait disturbances
- Headache
- Hyperactivity
- Hypersensitivity syndrome
- Impaired coordination
- Increase in seizure frequency
- Influenza-like symptoms
- Insomnia
- Nausea
- Nystagmus
- Oligomenorrhea
- Rash
- Rininitis
- Tremor
- Vomiting
- Weight loss

**ALLERGY AND CROSS-SENSITIVITY**

Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 184 for more information.

**PREGNANCY**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Caution and careful dose titration in mild to moderate impairment. Avoid in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be crushed and given in half a glass of water.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations → Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic rufinamide product.

**PATIENT AND CARER ADVICE**

Counselling on antiepileptic hypersensitivity syndrome is advised.

Sodium valproate

**INDICATIONS AND DOSE**

**All forms of epilepsy**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.
  - Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- **BY RECTUM**
  - Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.
  - Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day

**Initiation of valproate treatment**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: 10 mg/kg twice daily.
  - Child 1 month–11 years: Initially 10 mg/kg, then (by intravenous infusion or by intravenous injection) increased to 20–40 mg/kg daily in 2–4 divided doses,
alternatively (by continuous intravenous infusion) increased to 20–40 mg/kg daily, monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily

- Child 12-17 years: Initially 10 mg/kg, followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

**Continuation of valproate treatment**

- By intravenous injection, or by intravenous infusion, or by continuous intravenous infusion

- Child: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

**Epilepsy and other seizure disorders 201**

**BNFC 2017–2018**

**4**

**Nervous system**

- **CONTRA-INDICATIONS** Acute porphyrias p. 577 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction

- **CAUTIONS** Systemic lupus erythematosus

  **CAUTIONS, FURTHER INFORMATION**

  Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

  - Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

  - Common or very common Aggression · anaemia · confusion · convulsion · deafness · diarrhoea · extrapyramidal disorders · gastric irritation · haemorrhage · headache · hyponatraemia · memory impairment · menstrual disturbance · nausea · nystagmus · somnolence · stupor · thrombocytopenia · transient hair loss (regrowth may be curly) · tremor · weight gain

  - Uncommon Angioedema · ataxia · coma · encephalopathy · increased alertness · lethargy · leucopenia · pancytopenia · paraesthesia · peripheral oedema · rash · reduced bone mineral density · syndrome of inappropriate secretion of antidiuretic hormone · vasculitis

  - Rare Behavioural disturbance · blood disorders · bone marrow failure · drowsiness · drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · enuresis · Fanconi’s syndrome · hallucinations · hearing loss · hyperactivity · hyperammonaemia · hypothyroidism · learning disorders · male infertility · myelodysplastic syndrome · polycystic ovaries · Stevens–Johnson syndrome · systemic lupus erythematosus · toxic epidermal necrolysis

  - Very rare Acne · gynaecomastia · hepatic dysfunction · hirsutism · increase in bleeding time · pancreatitis

  - Frequency not known Hypersensitivity reactions · suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

- Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Exclude pregnancy before treatment—effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: VALPROATE AND RISK OF ABNORMAL PREGNANCY OUTCOMES**

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless alternative treatments are ineffective or not tolerated.

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RESOURCES TO SUPPORT THE SAFETY OF GIRLS AND WOMEN WHO ARE BEING TREATED WITH VALPROATE (APRIL 2017)**

The MHRA has published a set of resources, the valproate toolkit, to emphasise the need to avoid the use of valproate in girls and women of childbearing potential, warn women of the very high risks to the unborn child of valproate in pregnancy, and emphasise the need for effective contraception planning and specialist oversight of changes to medication when planning a pregnancy, as abrupt changes to medication can be harmful.

All organisations providing NHS-funded care where valproate is prescribed or dispensed should undertake systematic identification of girls and women who are taking valproate and ensure the MHRA resources are used to support them to make informed choices.

**EPILIM CHRONOSPHERE®**

**EPIVAL®**

**All forms of epilepsy**

- By mouth

  - Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

**SIDE-EFFECTS**

- Common or very common Aggression · anaemia · confusion · convulsion · deafness · diarrhoea · extrapyramidal disorders · gastric irritation · haemorrhage · headache · hyponatraemia · memory impairment · menstrual disturbance · nausea · nystagmus · somnolence · stupor · thrombocytopenia · transient hair loss (regrowth may be curly) · tremor · weight gain

- Uncommon Angioedema · ataxia · coma · encephalopathy · increased alertness · lethargy · leucopenia · pancytopenia · paraesthesia · peripheral oedema · rash · reduced bone mineral density · syndrome of inappropriate secretion of antidiuretic hormone · vasculitis

- Rare Behavioural disturbance · blood disorders · bone marrow failure · drowsiness · drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · enuresis · Fanconi’s syndrome · hallucinations · hearing loss · hyperactivity · hyperammonaemia · hypothyroidism · learning disorders · male infertility · myelodysplastic syndrome · polycystic ovaries · Stevens–Johnson syndrome · systemic lupus erythematosus · toxic epidermal necrolysis

- Very rare Acne · gynaecomastia · hepatic dysfunction · hirsutism · increase in bleeding time · pancreatitis

- Frequency not known Hypersensitivity reactions · suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

- Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

**CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Exclude pregnancy before treatment—effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all
efforts should be made to switch to appropriate alternative treatment prior to conception.

- **PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinnaemia) reported. Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.

- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

- **RENAL IMPAIRMENT** Reduce dose.

- **MONITORING REQUIREMENTS**
  - Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
  - Monitor liver function before therapy and during first 6 months especially in patients most at risk.
  - Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

- **TREATMENT CESSATION** Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous injection, may be diluted in Glucose 5% or Sodium Chloride 0.9% and given over 3–5 minutes. For intravenous infusion, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.
  - With rectal use For rectal administration, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).

- **EPIVAL** Tablets may be halved but not crushed or chewed.

- **EPISENTA® CAPSULES** Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

- **EPILIM® SYRUP** May be diluted, preferably in Syrup BP; use within 14 days.

- **EPISENTA® GRANULES** Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

- **EPILIM CHRONOSPHERE®** Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product.

- **EPILIM CHRONOSPHERE®** Prescribe dose to the nearest whole 50–mg sachet.

- **PATIENT AND CARER ADVICE**

  - Risk of abnormal pregnancy outcomes. A patient guide and card should be provided to all female patients.
  - Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.
  - Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Medical advice: Valproate and the risk of abnormal pregnancy outcomes

- Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:
  - the risks associated with valproate during pregnancy;
  - the need to use effective contraception;
  - the need for regular review of treatment;
  - the need to rapidly consult if she is planning a pregnancy or becomes pregnant.

- **EPISENTA® GRANULES**
  - Patients and carers should be counselled on the administration of granules.

- **EPISENTA® CAPSULES**
  - Patients and carers should be counselled on the administration of capsules.

- **EPILIM CHRONOSPHERE®**
  - Patients and carers should be counselled on the administration of granules.

- **MEDICINAL FORMS**

**Stiripentol**

- **INDICATIONS AND DOSE**
  - Adjunctive therapy of refractory generalised tonic-clonic seizures in children with severe myoclonic epilepsy in infancy (Dravet Syndrome) in combination with clobazam and valproate (under expert supervision)
  - **BY MOUTH**
  - Child 3–17 years: Initially 10 mg/kg daily in 2–3 divided doses, increased to up to 50 mg/kg daily in 2–3 divided doses, titrated over minimum of 3 days

- **CONTRA-INDICATIONS**
  - History of psychosis

- **INTERACTIONS**
  - Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - Common or very common
  - Aggression • anorexia • ataxia • drowsiness • dystonia • hyperexcitability • hyperskinesia • hypotonia • irritability • nausea • neutropenia • sleep disorders • vomiting • weight loss
  - Uncommon
  - Fatigue • photosensitivity • rash • urticaria

- **ALLERGY AND CROSS-SENSITIVITY**
  - Antiepileptic hypersensitivity syndrome theoretically associated with stiripentol. See under Epilepsy p. 184 for more information.

- **PREGNANCY**
  - The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING**
  - Present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Avoid—no information available.

- **RENAL IMPAIRMENT**
  - Avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter.
  - Monitor growth.

- **DIRECTIONS FOR ADMINISTRATION**
  - Do not take with milk, dairy products, carbonated drinks, fruit juice, or with food or drinks that contains caffeine.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Stiripentol for preventing seizures www.medicinesforchildren.org.uk/stiripentol-for-preventing-seizures

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder**

- **CAUTIONARY AND ADVISORY LABELS**
  - 1, 8, 13, 21

- **EXCIPIENTS:** May contain Aspartame

- **Diacomit (Alan Pharmaceuticals)**
  - Stiripentol 250 mg
  - Diacomit 250mg oral powder sachets | 50 sachet(s) [Pom] £28.40
  - Stiripentol 500 mg
  - Diacomit 500mg oral powder sachets | 60 sachet(s) [Pom] £49.30

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS**
  - 1, 8, 21

- **Diacomit (Alan Pharmaceuticals)**
  - Stiripentol 250 mg
  - Diacomit 250mg capsules | 60 capsule(s) [Pom] £28.40
  - Stiripentol 500 mg
  - Diacomit 500mg capsules | 60 capsule(s) [Pom] £49.30

**Tiagabine**

- **INDICATIONS AND DOSE**
  - Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)
  - **BY MOUTH**
  - Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

- **ADJUNCTIVE TREATMENT FOR FOCAL SEIZURES WITH OR WITHOUT SECONDARY GENERALISATION THAT ARE NOT SATISFACTORILY CONTROLLED BY OTHER ANTIPILEPTICS (WITHOUT ENZYME-INDUCING DRUGS)**
  - **BY MOUTH**
  - Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

- **CAUTIONS**
  - Avoid in acute porphyrias p. 577

- **CAUTIONS, FURTHER INFORMATION**
  - Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

- **INTERACTIONS**
  - Appendix 1: antiepileptics
Topiramate

### INDICATIONS AND DOSE

**Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation**

**BY MOUTH**

- Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 25–50 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day.

**Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation**

**BY MOUTH**

- Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day.

**Migraine prophylaxis**

**BY MOUTH**

- Child 16–17 years: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses, if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 200 mg per day.

### MEDICATION FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablet.

- **Gabitril (Teva UK Ltd)**
  - Tiagabine (as Tiagabine hydrochloride monohydrate)
    - 5 mg Gabitril® 5mg tablets [POD] £52.04
    - 10 mg Gabitril® 10mg tablets [POD] £104.09
    - Tiagabine (as Tiagabine hydrochloride monohydrate)
    - 15 mg Gabitril® 15mg tablets [POD] £156.13

### SIDE-EFFECTS

- **Common or very common** Diarrhoea, dizziness, emotional lability, impaired concentration, nervousness, speech impairment, tiredness, tremor.
- **Rare** Bruising, confusion, depression, drowsiness, non-convulsive status epilepticus, psychosis, suicidal ideation, visual disturbances.
- **Frequency not known** Leucopenia.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
May impair performance of skilled tasks (e.g. driving).

Medicines for Children leaflet: Tiagabine for preventing seizures: www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures

### UNLICENSED USE

Not licensed for use in children for migraine prophylaxis.

### CAUTIONS

Avoid in acute porphyrias. Avoid in acute myopia with secondary angle-closure glaucoma. In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

### INTERACTIONS

Appendix 1: Antiepileptics.

### SIDE-EFFECTS

- **Common or very common** Abdominal pain, aggression, agitation, alopecia, anaemia, anxiety, appetite changes, arthralgia, cognitive impairment, confusion, constipation, depression, diarrhoea, dizziness, drowsiness, dry mouth, dyspepsia, dysphagia, epistaxis, gastritis, impaired attention, impaired coordination, irritability, malaise, mood changes, movement disorders, muscle spasm, muscular weakness, myalgia, nausea, nephrolithiasis, nystagmus, paraesthesia, pruritus, rash, seizures, sleep disturbance, speech disorder, taste disturbance, tinnitus, tremor, urinary disorders, visual disturbances, vomiting.
- **Uncommon** Abdominal distension, altered sense of smell, blepharospasm, blood disorders, bradycardia, dry eye, flatulence, flushing, gingival bleeding, glossodynia, haematuria, halitosis, hearing loss, hypokalaemia, hypotension, increased lacrimation, influenza-like symptoms, leucopenia, metabolic acidosis, mydriasis, neutropenia, palpitation, pancreatitis, panic attack, peripheral neuropathy, photophobia, postural hypotension, psychosis, reduced sweating, salivation, sexual dysfunction, skin discoloration, suicidal ideation, thirst, thrombocytopenia, urinary calculus.
- **Very rare** Angle-closure glaucoma.
- **Frequency not known** Encephalopathy, hyperammonaemia, maculopathy, toxic epidermal necrolysis.

### SIDE-EFFECTS, FURTHER INFORMATION

- Acute myopia with secondary angle-closure glaucoma

Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intraocular pressure occurs:

- Seek specialist ophthalmological advice;
- Use appropriate measures to reduce intraocular pressure;
- Stop topiramate as rapidly as feasible.

**PREGNANCY** Increased risk of cleft palate if taken in the first trimester of pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

**BREAST FEEDING** Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.

**RENAI IMPAIRMENT** Half usual starting and maintenance dose if estimated glomerular filtration less than 70 ml/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration. Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

**TOPAMAX® CAPSULES** Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.
Epilepsy and other seizure disorders

Valproic acid

**INDICATIONS AND DOSE**

**CONVULEX®**

**Epilepsy**

- **BY MOUTH**
  - **Child 1 month–11 years:** Initially 10–15 mg/kg daily in 2–4 divided doses, max. 600 mg daily; usual maintenance 25–30 mg/kg daily in 2–4 divided doses, doses up to 60 mg/kg daily in 2–4 divided doses in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - **Child 12–17 years:** Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days;

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea · gastric irritation · hyperammonaemia · nausea · thrombocytopenia · transient hair loss (regrowth may be curly) · weight gain
- **Uncommon** Aggression · ataxia · behavioural disturbances · hyperactivity · increased alertness · tremor · vasculitis
- **Rare** Anaemia · blood disorders · confusion · drowsiness · hallucinations · hearing loss · hepatic dysfunction · lethargy · leptomenia · pancytopenia · rash · stupor
- **Very rare** Acne · coma · dementia · encephalopathy · enuresis · extrapyramidal symptoms · Fanconi's syndrome · gynaecomastia · hirsutism · hyponatraemia · increase in bleeding time · pancreatitis · peripheral oedema · reduced
bone mineral density · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis

- **Frequency not known** Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · hypersensitivity reactions · male infertility · menstrual disturbances · syndrome of inappropriate secretion of antidiuretic hormone

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
- Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

**CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

**PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia). Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.

**HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

**RENAL IMPAIRMENT** Reduce dose.

**MONITORING REQUIREMENTS**

- Monitor closely if dose greater than 45 mg/kg daily.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

**EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

**TREATMENT CESSION** Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

**PRESCRIBING AND DISPENSING INFORMATION**

**CONVULEX** Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.

**PATIENT AND CARER ADVICE**

Risk of abnormal pregnancy outcomes A patient guide and card should be provided to all female patients.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

**MHRA advice: Valproate and the risk of abnormal pregnancy outcomes** Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

- the risks associated with valproate during pregnancy;
- the need to use effective contraception;
- the need for regular review of treatment;
- the need to rapidly consult if she is planning a pregnancy or becomes pregnant.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS**

| 8, 21, 25, 10 |

**Vigabatrin**

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

**BY MOUTH**

- Neonate: Initially 15–20 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).

- Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

- Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

- Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

**BY RECTUM**

- Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

- Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

- Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

**Monotherapy in the management of infantile spasms in West’s syndrome** (under expert supervision)

**BY MOUTH**

- Neonate: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).

- **Vigabatrin 500 mg** Sabril 500mg tablets | 100 tablet [BNFC]
  - DT price = £44.41

---

**Zonisamide**

**INDICATIONS AND DOSE**
Adjunctive treatment for refractory focal seizures with or without secondary generalisation

- **BY MOUTH**
  - **Child 6-17 years (body-weight 20-54 kg):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
  - **Child 6-17 years (body-weight 55 kg and above):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, aggression, agitation, blurred vision, depression, dizziness, drowsiness, excitation, fatigue, headache, impaired concentration, impaired memory, irritability, nausea, nervousness, nystagmus, oedema, paraesthesia, paranoia, speech disorder, tremor, visual field defects, vomiting, weight gain
- **Uncommon** Ataxia, mania, occasional increase in seizure frequency (especially if myoclonic), psychosis, rash
- **Rare** Peripheral retinal neuropathy, retinal disorders, suicidal ideation
- **Very rare** Hepatitis, optic atrophy, optic neuritis
- **Frequency not known** Movement disorders in infantile spasms

**SIDE-EFFECTS, FURTHER INFORMATION**

- Encephalopahic symptoms
- Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.
- Visual field defects
- About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

**PREGNANCY**
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**
Present in milk—manufacturer advises avoid.

**RENAL IMPAIRMENT**
Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 ml/minute/1.73 m².

**MONITORING REQUIREMENTS**
Closely monitor neurological function.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use
  - The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- With rectal use
  - Dissolve contents of sachet in small amount of water and administer rectally (unlicensed use).

**PATIENT AND CARER ADVICE**
Patients and their carers should be warned to report any new visual symptoms that develop.

---

**Unlicensed Use**
Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

**Contra-Indications**
Visual field defects

**Caution**
History of behavioural problems - history of depression - history of psychosis

**Caution, Further Information**
Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

**Visual Field Defects**
Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded.

Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion.

Gradual withdrawal of vigabatrin should be considered.

**Interactions**
Appendix 1: antiepileptics

**Side-Effects**

- Common or very common: Abdominal pain, agitation, aggression, ataxia, confusion, constipation, depression, diarrhea, dizziness, drowsiness, excitation, fatigue, headache, impaired concentration, impaired memory, irritability, nausea, nervousness, nystagmus, oedema, paraesthesia, paranoia, speech disorder, tremor, visual field defects, vomiting, weight gain
- Uncommon: Ataxia, mania, occasional increase in seizure frequency (especially if myoclonic), psychosis, rash
- Rare: Peripheral retinal neuropathy, retinal disorders, suicidal ideation
- Very rare: Hepatitis, optic atrophy, optic neuritis
- Frequency not known: Movement disorders in infantile spasms

**Side-Effects, Further Information**

- Encephalopahic symptoms
- Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.
- Visual field defects
- About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

**Pregnancy**
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**Breast Feeding**
Present in milk—manufacturer advises avoid.

**Renal Impairment**
Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 ml/minute/1.73 m².

**Monitoring Requirements**
Closely monitor neurological function.

**Directions for Administration**

- With oral use
  - The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- With rectal use
  - Dissolve contents of sachet in small amount of water and administer rectally (unlicensed use).

**Patient and Carer Advice**
Patients and their carers should be warned to report any new visual symptoms that develop.
myasthenic syndrome • neuroleptic malignant syndrome • pancreatitis • renal failure • renal tubular acidosis • rhabdomyolysis • Stevens-Johnson syndrome • toxic epidermal necrolysis

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity. Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 184 for more information.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.

- **HEPATIC IMPAIRMENT** Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **Switching between formulations** Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

  - **Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.**

- **PATIENT AND CARER ADVICE**

  - Children and their carers should be made aware of how to prevent and recognise overheating and dehydration. Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **Scottish Medicines Consortium (SMC) Decisions**

    - The **Scottish Medicines Consortium** has advised (February 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - **Capsule**

    - **CAUTIONARY AND ADVISORY LABELS** 3, 8, 10

    - **Zonisamide (Non-proprietary)**

      - **Zonisamide 25 mg** Zonisamide 25mg capsules | 14 capsule £7.83–£8.22 DT price = £8.66

      - **Zonisamide 50 mg** Zonisamide 50mg capsules | 56 capsule £41.74–£47.04 DT price = £46.16

      - **Zonisamide 100 mg** Zonisamide 100mg capsules | 56 capsule £56.07–£62.72 DT price = £62.20

    - **Zonegran (Eisai Ltd)**

      - **Zonisamide 25 mg** Zonisamide 25mg capsules | 14 capsule £8.82 DT price = £8.66

      - **Zonisamide 50 mg** Zonisamide 50mg capsules | 56 capsule £47.04 DT price = £46.16

      - **Zonisamide 100 mg** Zonisamide 100mg capsules | 56 capsule £62.72 DT price = £62.20

- **ANTIEPILEPTICS > BARBITURATES**

  - **Phenobarbital**

    - **(Phenobarbitone)**

      - **INDICATIONS AND DOSE**

        - **All forms of epilepsy except typical absence seizures**

          - **BY MOUTH**

            - Child 1 month–11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day

            - Child 12–17 years: 60–180 mg once daily

          - **INITIALLY BY SLOW INTRAVENOUS INJECTION**

            - Neonate: Initially 20 mg/kg, then (by slow intravenous injection or by mouth) 2.5–5 mg/kg once daily, adjusted according to response.

        - **Status epileptics**

          - **BY SLOW INTRAVENOUS INJECTION**

            - Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

            - Child 1 month–11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day

            - Child 12–17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

          - **DOSE EQUIVALENCE AND CONVERSION**

            - For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

      - **CAUTIONS**

        - Avoid in acute porphyrias p. 577 • children • debilitated • history of alcohol abuse • history of drug abuse • respiratory depression (avoid if severe)

      - **CAUTIONS, FURTHER INFORMATION**

        - Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

      - **INTERACTIONS**

        - **Appendix 1: antiepileptics**

      - **SIDE-EFFECTS**

        - **Common or very common**

          - Agranulocytosis • allergic skin reactions • ataxia • behavioural disturbances • cholestasis • depression • drowsiness • hallucinations • hepatitis • hyperactivity particularly in the elderly and in children • hypotension • impaired cognition • impaired memory • irritability • lethargy • megaloblastic anaemia (may be treated with folic acid) • nystagmus • osteomalacia • respiratory depression • thrombocytopenia

        - **Very rare**

          - Antiepileptic hypersensitivity syndrome • Stevens-Johnson syndrome • suicidal ideation • toxic epidermal necrolysis

          - **Frequency not known** Hyperkinesia

      - **Overdose**

        - For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 803.

      - **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 184 for more information.

      - **PREGNANCY**

        - The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

      - **BREAST FEEDING** Avoid if possible; drowsiness may occur.

      - **HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.

      - **RENAL IMPAIRMENT** Use with caution.
### Primidone

#### INDICATIONS AND DOSE

**All forms of epilepsy except typical absence seizures**

- **BY MOUTH**
  - Child 1 month-1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily.
  - Child 2-4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily.
  - Child 5-8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS  
BENZODIAZEPINES

Benzodiazepines

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency - marked neuromuscular respiratory weakness - sleep apnoea syndrome - unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) - history of alcohol dependence or abuse - history of drug dependence or abuse - myasthenia gravis - respiratory disease

**CAUTIONS, FURTHER INFORMATION**
- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**SIDE-EFFECTS**

**Overdose**

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 803.

**PREGNANCY**

Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see Drugs and Skilled Tasks under Guidance on prescribing p. 1.

Clobazam

**INDICATIONS AND DOSE**

Adjunct in epilepsy

- **BY MOUTH**
  - Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maximum 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
  - Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

**Monotherapy for catamenial (menstruation) seizures (usually for 7–10 days each month, just before and during menstruation) (under expert supervision)**

**Cluster seizures**

- **BY MOUTH**
  - Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day

**UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.

**IMPORTANT SAFETY INFORMATION**

Do not confuse with clonazepam.

- **CONTRA-INDICATIONS** Hyperkinesis - obsessional states - phobic states - respiratory depression
- **CAUTIONS** Muscle weakness - organic brain changes - personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

**INTERACTIONS** → Appendix 1: clobazam

**SIDE-EFFECTS**

- Common or very common Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- Uncommon Dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - incontinence - salivation changes - tremor - visual disturbances
- Rare Apnoea - blood disorders - changes in libido - headache - hypotension - jaundice - respiratory depression - skin reactions - urinary retention - vertigo
- Frequency not known Delusions - excitement - hallucinations - irritability - psychosis - restlessness

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**MONITORING REQUIREMENTS** Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clobazam product.
Clonazepam

**INDICATIONS AND DOSE**

**All forms of epilepsy**

**By mouth**

- Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 1–4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 5–11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 3–6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 12–17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, dose usually taken at night; may be given in 3–4 divided doses if necessary

**OFFICIAL AND PRIORITY TABLETS**

- Clonazepam 1 mg/5 ml oral suspension sugar-free 150 ml (Pom) £90.00 (CD1-1) sugar-free | 250 ml (Pom) £150.00 (CD1-3)
- Clonazepam 2 mg/5 ml oral suspension sugar-free 150 ml (Pom) £95.00 (CD1-1) sugar-free | 250 ml (Pom) £162.50 (CD1-3)
- Clonazepam 1 mg/1 ml orodispersible tablet 30 tablet (Pom) £3.36 DT price = £3.27 (CD1-1)
- Clonazepam 1 mg/1 ml Tablet 100 tablet (Pom) £2.51 DT price = £2.27 (CD1-1)

**INTERACTIONS**

- **Acute porphyrias** p. 577
- **airways obstruction**
- **brain damage**
- **cerebellar ataxia**
- **depression**
- **spinal ataxia**
- **suicidal ideation**

**CAUTIONS, FURTHER INFORMATION**

- The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.
- **Antidepressants**
- **Benzodiazepines**
- **Carbamazepine**
- **Citalopram**
- **Fluoxetine**
- **Lamotrigine**
- **Levodopa**
- **Lithium**
- **Olanzapine**
- **Paroxetine**
- **Quetiapine**
- **Sertraline**
- **Venlafaxine**

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Clonazepam for preventing seizures www.medicinesforchildren.org.uk/clonazepam-preventing-seizures-0

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension
Diazepam

### INDICATIONS AND DOSE

#### Tetanus
- **BY INTRAVENOUS INJECTION**
  - Child: 100–300 micrograms/kg every 1–4 hours
  - BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE
  - Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

#### Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm
- **BY MOUTH**
  - Child 1-11 months: Initially 250 micrograms/kg twice daily
  - Child 1–4 years: Initially 2.5 mg twice daily
  - Child 5–11 years: Initially 5 mg twice daily
  - Child 12–17 years: Initially 10 mg twice daily; maximum 40 mg per day

#### Status epilepticus | Febrile convulsions | Convulsions due to poisoning
- **BY INTRAVENOUS INJECTION**
  - Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
  - Child 1 month–11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
  - Child 12–17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
- **BY RECTUM**
  - Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
  - Child 1 month–1 year: 5 mg, then 5 mg after 10 minutes if required
  - Child 2–11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
  - Child 12–17 years: 10–20 mg, then 10–20 mg after 10 minutes if required

#### Life-threatening acute drug-induced dystonic reactions
- **BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 100 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
  - Child 12–17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

---

### IMPORTANT SAFETY INFORMATION

#### ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

#### CONTRA-INDICATIONS

#### CAUTIONS

**GENERAL CAUTIONS**

Muscle weakness. Organic brain changes. Parenteral administration (close observation required until full recovery from sedation). Personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence.

**SPECIFIC CAUTIONS**

- With intravenous use: High risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation).

**CAUTIONS, FURTHER INFORMATION**

Special precautions for intravenous injection. When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

#### INTERACTIONS

Appendix 1: Diazepam

#### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

- **Common or very common**
  - Amnesia
  - Ataxia
  - Confusion
  - Dependence
  - Drowsiness
  - Lightheadedness
  - Next day: Muscle weakness
  - Paradoxical increase in aggression

- **Uncommon**
  - Dizziness
  - Dysarthria
  - Gastro-intestinal disturbances
  - Gynaecomastia
  - Incontinence
  - Salivation
  - Changes: Tremor
  - Visual disturbances

- **Rare**
  - Apnoea
  - Blood disorders
  - Changes in libido
  - Headache
  - Hypotension
  - Jaundice
  - Respiratory depression
  - Skin reactions
  - Urinary retention
  - Vertigo

- **Frequency not known**
  - Delusions
  - Excitement
  - Hallucinations
  - Hypotonia
  - (When used for muscle spasm)
  - Irritability
  - Marked respiratory depression, particularly with high dose (facilities for its treatment are essential)
  - Psychosis
  - Restlessness

**SPECIFIC SIDE-EFFECTS**

- With intravenous use
  - Pain
  - Thrombophlebitis

**PREGNANCY**

Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Epilepsy and Pregnancy Register: All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 08000 389 1248).

**BREAST FEEDING**

Present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT**

Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Start with small doses in severe impairment.

---

**UNLICENSED USE**

Diazepam Desitin®, Diazepam Rectubes®, and Stesolid Rectal Tubes® not licensed for use in children under 1 year.
● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection. 

  For continuous intravenous infusion of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion.

  For continuous intravenous infusion of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration.

Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

Medicines for Children leaflet: Diazepam (rectal) for stopping seizures www.medicinesforchildren.org.uk/diazepam-rectal-stopping-seizures-

Medicines for Children leaflet: Diazepam for muscle spasm www.medicinesforchildren.org.uk/diazepam-for-muscle-spasm

● PROFESSIONAL SPECIFIC INFORMATION

Dental practitioners’ formulary

Diazepam Tablets may be prescribed.

Diazepam Oral Solution 2 mg/5 mL may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

ANTIEPILEPTICS

Paraldehyde

● INDICATIONS AND DOSE

Status epilepticus

- By Rectum

  Neonate: 0.8 mL/kilogram for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes.

  Child: 0.8 mL/kilogram (max. per dose 20 mL) for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes

● UNLICENSED USE

  Not licensed for use in children as an enema.

● CONTRA-INDICATIONS

  Gastric disorders • rectal administration in colitis

● CAUTIONS

  Bronchopulmonary disease

● INTERACTIONS

  Appendix 1: antiepileptics

● SIDE-EFFECTS

  Rash

● PREGNANCY

  Avoid unless essential—crosses placenta.

● BREAST FEEDING

  Avoid unless essential—present in milk.

● HEPATIC IMPAIRMENT

  Use with caution.

ANTIEPILEPTICS ▶ BARBITURATES

Thiopental sodium (Thiopentone sodium)

- **INDICATIONS AND DOSE**
  - **Prolonged status epilepticus**
    - Initially by slow intravenous injection
  - **Induction of anaesthesia**
    - Initially by slow intravenous injection
  - **Neonate**: Initially up to 2 mg/kg, then by continuous intravenous infusion up to 8 mg/kg/hour, adjusted according to response.
  - **Child**: Initially up to 4 mg/kg, then by continuous intravenous infusion up to 8 mg/kg/hour, adjusted according to response.

- **SIDE-EFFECTS**
  - Arrhythmias
  - Hypersensitivity reactions
  - Hypotension
  - Laryngeal spasm
  - Myocardial depression
  - Rash

- **INTERACTIONS**
  - Thiopental may increase the risk of convulsions caused by poisoning.

- **PRECAUTIONS**
  - Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Acute porphyrias
  - Myotonic dystrophy

- **CAUTIONS**
  - Acute circulatory failure (shock)
  - Avoid injections containing benzyl alcohol in neonates
  - CNS depression
  - Compromised airway
  - Hyperkinesis
  - Obsessional states
  - Phobic states
  - Respiratory depression

- **PREGNANCY**
  - May depress neonatal respiration when used during delivery.

- **BREAST FEEDING**
  - Breastfeeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **HEPATIC IMPAIRMENT**
  - Use with caution—reduce dose.

- **RENAL IMPAIRMENT**
  - Caution in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous injection, reconstitute 500-mg vial with 20 mL Water for Injections to give 25 mg/mL solution; give over at least 10–15 seconds; for intravenous infusion reconstituted solution may be further diluted with Sodium Chloride 0.9%.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- **UNLICENSED USE**
  - Not licensed for use in status epilepticus. Not licensed for use by intravenous infusion.

- **IMPORTANT SAFETY INFORMATION**
  - Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- **Powder for solution for injection**
  - Thiopental sodium (Non-proprietary)
    - Thiopental sodium 500 mg

HYPNOTICS, SEDATIVES AND ANXIOLYTICS ▶ BENZODIAZEPINES

Lorazepam

- **INDICATIONS AND DOSE**
  - **Premedication**
    - By mouth
      - Child 1 month–11 years: 50–100 micrograms/kg (max. per dose 4 mg), to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure.
      - Child 12–17 years: 1–4 mg, to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure.

- **INDUCTION OF ANAESTHESIA**
  - Initially by slow intravenous injection
  - Neonate: 50–100 micrograms/kg (max. per dose 4 mg), to be administered 30–45 minutes before procedure.

- **STATUS EPILEPTICUS | FEBRILE CONVULSIONS | CONVULSIONS CAUSED BY POISONING**
  - Initially by slow intravenous injection
    - Neonate: 100 micrograms/kg for 1 dose, then 100 micrograms/kg after 10 minutes if required for 1 dose, to be administered into a large vein.
    - Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein.
    - Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein.

- **UNLICENSED USE**
  - Not licensed for use as oral premedication in children under 5 years.
  - Not licensed for use as intravenous premedication in children under 12 years.

- **IMPORTANT SAFETY INFORMATION**
  - Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS**
  - Avoid injections containing benzyl alcohol in neonates
  - CNS depression
  - Compromised airway
  - Hyperkinesis
  - Obsessional states
  - Phobic states
  - Respiratory depression

- **CAUTIONS**
  - Personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence
  - Muscle weakness
  - Organic brain changes
  - Parenteral administration

- **CAUTIONS, FURTHER INFORMATION**
  - Paradoxical effects
    - A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the
Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

**INTERACTIONS** → Appendix 1: lorazepam

**SIDE-EFFECTS**

- **Common or very common** Amnesia, ataxia, confusion, dependence, drowsiness the next day, lightheadedness the next day, muscle weakness, paradoxical increase in aggression
- **Uncommon** Dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia, insomnia, salivation changes, tremor, visual disturbances
- **Rare** Apnoea, blood disorders, changes in libido, headache, hypotension, jaundice, respiratory depression, skin reactions, urinary retention, vertigo
- **Frequency not known** Delusions, excitement, hallucinations, irritability, marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential), pain (on intravenous injection), psychosis, restlessness, thrombophlebitis (on intravenous injection)

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug.

**SOLUTION FOR INJECTION**

**EXCIPIENTS:** May contain Benzyl alcohol, propylene glycol

- Ativan (Pfizer Ltd)
  - Lorazepam 4 mg per 1 ml Ativan 4mg/1ml solution for injection ampoules | 10 ampoule [POM] £3.54 [CD4-1]

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 2, 19

- **Lorazepam (Non-proprietary)**
  - Lorazepam 1 mg Lorazepam 1mg tablets | 28 tablet [POM] £6.90 DT price = £4.41 [CD4-1] | 30 tablet [POM] no price available [CD4-1]
  - Lorazepam 2.5 mg Lorazepam 2.5mg tablets | 28 tablet [POM] £12.20 DT price = £12.20 [CD4-1] | 30 tablet [POM] no price available [CD4-1]

**INDICATIONS AND DOSE**

**Status epilepticus | Febrile convulsions**

- **BY BUCCAL ADMINISTRATION**
  - Neonate: 300 micrograms/kg, then 300 micrograms/kg after 10 minutes if required.
  - Child 1–2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
  - Child 3–11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
  - Child 1–4 years: 5 mg, then 5 mg after 10 minutes if required
  - Child 5–9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
  - Child 10–17 years: 10 mg, then 10 mg after 10 minutes if required

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled.
  - Child: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled

**Conscious sedation for procedures**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be administered 30–60 minutes before procedure

- **BY BUCCAL ADMINISTRATION**
  - Child 6 months–9 years: 200–300 micrograms/kg (max. per dose 5 mg)
  - Child 10–17 years (body-weight up to 70 kg): 6–7 mg
  - Child 10–17 years (body-weight 70 kg and above): 6–7 mg (max. per dose 8 mg)

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before procedure

- **BY INTRAVENOUS INJECTION**
  - Child 1 month–5 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 6 mg per course
  - Child 6–11 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 10 mg per course
  - Child 12–17 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 7.5 mg per course

**Premedication**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be taken 15–30 minutes before the procedure

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before induction

  continued →
Induction of anaesthesia (but rarely used)
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 7-17 years: Initially 150 micrograms/kg (max. per dose 7.5 mg), dose to be given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes before subsequent dosing, then 50 micrograms/kg every 2 minutes (max. per dose 2.5 mg) if required; maximum 500 micrograms/kg per course; maximum 25 mg per course

Sedation of patient receiving intensive care
- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Child 6 months-11 years: Initially 50–200 micrograms/kg, to be administered over at least 3 minutes, followed by (by continuous intravenous infusion) 30–120 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia
- Child 12-17 years: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, followed by (by continuous intravenous infusion) 30–200 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate up to 32 weeks corrected gestational age: 60 micrograms/kg/hour, then reduced to 30 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
  - Neonate 32 weeks corrected gestational age and above: 60 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
  - Child 1-5 months: 60 micrograms/kg/hour, adjusted according to response

**UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature. Injection not licensed for use in status epilepticus or febrile convulsions. Not licensed for use in children under 6 months for premedication and conscious sedation.

Not licensed for use by mouth. Not licensed for use by buccal administration for conscious sedation.

**IMPORTANT SAFETY INFORMATION**

**ANAESTHESIA**
Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE**
The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**CONTRA-INDICATIONS** CNS depression • compromised airway • severe respiratory depression

**CAUTIONS** Cardiac disease • children (particularly if cardiovascular impairment) • concentration of midazolam in children under 15 kg not to exceed 1 mg/mL • debilitated patients (reduce dose) • hypothermia • hypovolaemia (risk of severe hypotension) • neonates • risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) • vasoconstriction

**CAUTIONS, FURTHER INFORMATION**
- Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**INTERACTIONS** → Appendix 1: midazolam

**SIDE-EFFECTS** Amnesia • anaphylaxis • ataxia • blood disorders • bronchospasm • cardiac arrest • confusion • convulsions (more common in neonates) • depression of consciousness • dizziness • drowsiness • dry mouth • dysarthria • euphoria • fatigue • gastro-intestinal disturbances • hallucinations • headache • heart rate changes • hiccup • hypotension • incontinence • increased appetite • injection-site reactions • involuntary movements • jaundice • laryngospasm • muscle weakness • paradoxical aggression • paradoxical excitement • respiratory arrest (particularly with high doses or on rapid injection) • respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) • respiratory depression (particularly with high doses or on rapid injection) • restlessness (with sedative and peri-operative use) • salivation changes • severe disinhibition (with sedative and peri-operative use) • skin reactions • thrombosis • urinary retention • vertigo • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
- Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

**OVERDOSE**
There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in hepatic impairment. May cause myoclonus in patients with hepatic impairment.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%. For intravenous injection in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure–like myoclonus in preterm neonate. For neonate and children under 15 kg dilute to a maximum concentration of 1 mg/mL. Neonatal intravenous care, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.
- With oral use For administration by mouth for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.
**ATTENTION DEFICIT HYPERACTIVITY DISORDER**

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder (initiated by a specialist)**

**BY MOUTH**

- **Child 6–17 years (body-weight up to 70 kg):** Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given as 2 divided doses in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day.

- **Child 6–17 years (body-weight 70 kg and above):** Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day.

**CAUTIONARY AND ADVISORY LABELS**

- **Patients or carers should be given advice on how to administer midazolam oromucosal solution.**
- **Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards.** For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

    - Buccolam 2.5mg/0.5ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose | $82.00 DT price = $82.00 [CD3]

---

**2 Mental health disorders**

**2.1 Attention deficit hyperactivity disorder**

**Attention deficit hyperactivity disorder**

**Management**

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the child and carers. Methylphenidate hydrochloride p. 218 and atomoxetine below are used for the management of ADHD; dexamfetamine sulfate p. 220 and lisdexamfetamine mesilate p. 221 are an alternative in children who do not respond to these drugs. Guanfacine p. 222, a non-stimulant alpha2-adrenoceptor agonist, can be used in children for whom stimulants are not suitable, not tolerated, or ineffective. Therapeutic response to guanfacine should be evaluated every 3 months for the first year and then at least yearly, when prescribed for extended periods.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

A tricyclic antidepressant such as imipramine hydrochloride p. 231 is sometimes used in the treatment of ADHD; it should not be prescribed concomitantly with a CNS stimulant.
Atomoxetine (as Atomoxetine hydrochloride) 80 mg
Atomoxetine (as Atomoxetine hydrochloride) 60 mg
Atomoxetine (as Atomoxetine hydrochloride) 40 mg
Atomoxetine (as Atomoxetine hydrochloride) 25 mg

**SIDE-EFFECTS**
- **Common or very common**: Abdominal pain, anorexia, anxiety, chills, constipation, depression, dermatitis, dizziness, drowsiness, dry mouth, dyspepsia, flatulence, flushing, headache, increased blood pressure, irritability, lethargy, malaise, mydriasis, nausea, palpitation, paraesthesia, prostatitis, rash, sexual dysfunction, sleep disturbances, sweating, tachycardia, taste disturbances, tremor, urinary dysfunction, vomiting.
- **Uncommon**: Aggression, cold extremities, emotional lability, hostility, hypoaesthesia, menstrual disturbances, muscle spasms, pruritus, psychosis, QT-interval prolongation, suicidal ideation, syncope, tics.
- **Rare**: Raynaud’s phenomenon, seizures.
- **Very rare**: Angle-closure glaucoma, hepatic disorders.

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**
Avoid present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Halve dose in moderate impairment. Quarter dose in severe impairment.

**MONITORING REQUIREMENTS**
- Monitor for appearance or worsening of anxiety, depression or tics.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**PATIENT AND CARER ADVICE**
Suicidal ideation. Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.
Hepatic impairment. Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (December 2015) that atomoxetine oral solution (Strattera®) is accepted for restricted use, within its licensed indications, for treating patients who are unable to swallow capsules.

**INDICATIONS AND DOSE**
Attention deficit hyperactivity disorder (initiated under specialist supervision)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 4–5 years: Initially 2.5 mg twice daily, increased in steps of 2.5 mg daily if required, at weekly intervals, increased if necessary up to 4.4 mg/kg daily in 2–3 divided doses, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation
  - Child 6–17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

**DOSE EQUIVALENCE AND CONVERSION**
- When switching from immediate-release preparations to modified-release preparations—consult product literature.

**CONCERTA® XL**
Attention deficit hyperactivity disorder
- **BY MOUTH**
  - Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.
DOSE EQUIVALENCE AND CONVERSION
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Concerta® XL 18 mg once daily.

DELMOSART® PROLONGED-RELEASE TABLET
Attention deficit hyperactivity disorder (under expert supervision)
- BY MOUTH
- Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Delmosart® 18 mg once daily.

EQUASYM® XL
Attention deficit hyperactivity disorder
- BY MOUTH
- Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

MEDIKINET® XL
Attention deficit hyperactivity disorder
- BY MOUTH
- Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

UNLICENSED USE
Doses over 60 mg daily not licensed; doses of Concerta XL over 54 mg daily not licensed.
Not licensed for use in children under 6 years.

CONTRA-INDICATIONS
Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · phaeochromocytoma · psychosis · severe depression · severe hypertension · structural cardiac abnormalities · suicidal ideation · uncontrolled bipolar disorder · vasculitis

CAUTIONS
Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics

CONCERTA® XL, DELMOSART®
Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)

INTERACTIONS
- Appendix 1: methylphenidate

SIDE-EFFECTS
- Common or very common Abdominal pain · aggression · alopecia · anorexia · arrhythmias · arthralgia · asthenia · changes in blood pressure · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · fever · growth restriction · headache · insomnia · irritability · movement disorders · nasopharyngitis · nausea · nervousness · palpitation · pruritus · rash · reduced weight gain · tachycardia · tics · vomiting
- Uncommon Abnormal dreams · confusion · constipation · dysphonia · epistaxis · haematuria · muscle cramps · suicidal ideation · urinary frequency
- Rare Angina · sweating · visual disturbances;
- Very rare Angle-closure glaucoma · blood disorders · cerebral arteritis · dependence · erythema multiforme · exfoliative dermatitis · hepatic dysfunction · leucopenia · myocardial infarction · neuroleptic malignant syndrome · psychosis · seizures · thrombocytopenia · tolerance · Tourette syndrome

FREQUENCY not known
Bradycardia · convulsions · supraventricular tachycardia

PREGNANCY
Limited experience—avoid unless potential benefit outweighs risk.

BREAST FEEDING
Limited information available—avoid.

MONITORING REQUIREMENTS
- Monitor for psychiatric disorders.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

TREATMENT CESSATION
Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION
MEDIKINET® XL
Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

EQUASYM® XL
Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

PRESCRIBING AND DISPENSING INFORMATION
Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL
Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

MEDIKINET® XL
Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

EQUASYM® XL
Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

PATIENT AND CARER ADVICE
Drugs and Driving
Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see Drugs and Skilled Tasks under Guidance on prescribing p. 1.

CONCERTA® XL, DELMOSART®
Tablet membrane may pass through gastro-intestinal tract unchanged.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (Tas)
Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98
Methylphenidate is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.
www.nice.org.uk/TA98

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25
- Concerta XL (Janssen-Cilag Ltd)
Methylphenidate hydrochloride 18 mg Concerta XL 18 mg tablets

  Medikinet hydrochloride 30 mg Medikinet 30mg capsules | 30 capsule (POM) £33.66 DT price = £35.00 (CD)
  Medikinet hydrochloride 40 mg Medikinet 40mg capsules | 30 capsule (POM) £57.72 DT price = £57.72 (CD)
  Medikinet hydrochloride 50 mg Medikinet 50mg capsules | 30 capsule (POM) £52.52 (CD)
  Medikinet hydrochloride 60 mg Medikinet 60mg capsules | 30 capsule (POM) £67.32 (CD)

### CNS Stimulants > Centrally Acting Sympathomimetics > Amphetamines

#### Dexamfetamine sulfate

**(Dexamphetamine sulfate)**

- **INDICATIONS AND DOSE**
  Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)
  - **BY MOUTH**
    - Child 6–17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)

- **CONTRA-INDICATIONS**
  - Agitated states, cardiovascular disease, history of alcohol abuse, history of drug abuse, hyperexcitability, hyperthyroidism, moderate hypertension, severe hypertension, structural cardiac abnormalities

- **CAUTIONS**
  - Anorexia, bipolar disorder, history of epilepsy (discontinue if seizures occur), mild hypertension, psychosis, susceptibility to angle-closure glaucoma, tics, Tourette syndrome

- **CAUTIONS, FURTHER INFORMATION**
  - Tics and Tourette syndrome: Discontinue use if tics occur.
  - Growth restriction in children: Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity)

- **INTERACTIONS**
  - Appendix 1: amphetamines

- **SIDE-EFFECTS**
  - Common or very common: Abdominal cramps, acidosis, aggression, alopecia, anhedonia, anorexia, anxiety, ataxia, cardiomyopathy, cardiovascular collapse, cerebrum, chest pain, confusion, depression, diarrhoea, dizziness, dry mouth, dysphoria, euphoria, growth restriction in children, headache, hyperactivity, hyperpyrexia, hyperreflexia, hypertension, hypotension, impaired concentration, irritability, ischaemic colitis, malaise, mydriasis, myocardial infarction, nausea, nervousness, neuroleptic malignant syndrome, obsessive-compulsive behaviour, palpitations, panic attack, paranoia, psychosis, rash, renal impairment, restless leg syndrome, seizures, sexual dysfunction, sleep disturbances, stroke, sweating, tachycardia, taste disturbances, Tourette syndrome (in predisposed individuals), tremor, uticaria, visual disturbances, weight loss

- **Very rare**
  - Angle-closure glaucoma

- **Frequency not known**
  - Choreaathetoid movements (in predisposed individuals), dyskinesia (in predisposed individuals), increased appetite, tics (in predisposed individuals)

### Overdose

- **PREGNANCY**
  - Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity)

- **BREAST FEEDING**
  - Significant amount in milk—avoid.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **MONITORING REQUIREMENTS**
  - Monitor growth in children.
Monitor for aggressive behaviour or hostility during initial treatment.

Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION** Tablets can be halved.

**PRESCRIBING AND DISPENSING INFORMATION** Data on safety and efficacy of long-term use not complete.

**PATIENT AND CARER ADVICE**

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see *Drugs and Skilled Tasks* under Guidance on prescribing p. 1.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

**Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD)** (March 2006) NICE TA98

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

**MEDICINAL FORMS**

  - **Dexamfetamine sulfate 20 mg** Amfexa 20mg tablets | 30 tablet [POM] £79.56 [CD2]

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)**

- **BY MOUTH**

  - **Child 6–17 years** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

**CONTRA-INDICATIONS** Advanced arteriosclerosis - agitated states - hyperexcitability - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

**CAUTIONS** Anorexia - bipolar disorder - history of alcohol abuse - history of cardiac abnormalities - history of cardiovascular disease - history of drug abuse - may lower seizure threshold (discontinue if seizures occur) - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

**CAUTIONS, FURTHER INFORMATION**

- Tics and Tourette syndrome Discontinue use if tics occur.

- Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

**INTERACTIONS** Appendix 1: amphetamines

**SIDE-EFFECTS**

- **Common or very common** Abdominal cramps - aggression - decreased appetite - diarrhoea - dizziness - drowsiness - dry mouth - dysphoria - growth restriction in children - headache - labile mood - malaise - mydriasis - nausea - pyrexia - sleep disturbances - tics - vomiting - weight loss

- **Uncommon** Anorexia - anxiety - depression - dermatomalgia - dysphoria - hallucination - hypertension - logorrhoea - malaise - palpitation - paranoia - rash - restlessness - sexual dysfunction - sweating - tachycardia - tremor - visual disturbances

- **Very rare** Angle-closure glaucoma

- **Frequency not known** Cardiomyopathy - choreoathetoid movements (in predisposed individuals) - dyskinesia (in predisposed individuals) - euphoria - seizures - Tourette syndrome (in predisposed individuals)

**Overdose**

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in human milk.

**RENAI IMPAIRMENT** Max. dose 50 mg daily in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for aggressive behaviour or hostility during initial treatment.

- Monitor growth in children.

- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**Lisdexamfetamine mesilate**

**DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)**

- **BY MOUTH**

  - **Child 6–17 years** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

**CONTRA-INDICATIONS** Advanced arteriosclerosis - agitated states - hyperexcitability - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

**CAUTIONS** Anorexia - bipolar disorder - history of alcohol abuse - history of cardiac abnormalities - history of cardiovascular disease - history of drug abuse - may lower seizure threshold (discontinue if seizures occur) - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

**CAUTIONS, FURTHER INFORMATION**

- Tics and Tourette syndrome Discontinue use if tics occur.

- Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

**INTERACTIONS** Appendix 1: amphetamines

**SIDE-EFFECTS**

- **Common or very common** Abdominal cramps - aggression - decreased appetite - diarrhoea - dizziness - drowsiness - dry mouth - dysphoria - growth restriction in children - headache - labile mood - malaise - mydriasis - nausea - pyrexia - sleep disturbances - tics - vomiting - weight loss

**Overdose**

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in human milk.

**RENAI IMPAIRMENT** Max. dose 50 mg daily in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for aggressive behaviour or hostility during initial treatment.

- Monitor growth in children.

- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION** Avoid abrupt withdrawal.
DIRECTIONS FOR ADMINISTRATION  Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

PATIENT AND CARER ADVICE
Patients and carers should be counselled on the administration of capsules.

Drugs and Driving  Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and Skilled Tasks under Guidance on prescribing p. 1.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

AGONISTS

SYMPATHOMIMETICS  \( \text{\textalpha}_2 \)-ADRENOCEPTOR AGONISTS

Guanfacine

INDICATIONS AND DOSE
Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

BY MOUTH

Child 6-12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature

Child 13-17 years (body-weight 34-41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature

Child 13-17 years (body-weight 41.5-49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature

INDICATIONS AND DOSE
Child 13-17 years (body-weight 49.5-58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature

Child 13-17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inhibitors of CYP3A4—no specific recommendation made for children.

CAUTIONS
Bradycardia (risk of torsade de pointes) · heart block (risk of torsade de pointes) · history of cardiovascular disease · history of QT-interval prolongation · hypokalaemia (risk of torsade de pointes)

INTERACTIONS  \( \rightarrow \) Appendix 1: guanfacine

SIDE-EFFECTS
Common or very common Abdominal pain · anxiety · bradycardia · constipation · decreased appetite · depression · diarrhoea · dizziness · dry mouth · enuresis · headache · hypotension · irritability · malaise · mood lability · nausea · rash · sleep disturbance · somnolence · vomiting · weight increase

Uncommon Agitation · chest pain · convulsion · dyspepsia · first-degree AV block · hallucination · pallor · pollakuria · pruritus · sinus arrhythmia · syncope · tachycardia

Rare Hypertension

Frequency not known Suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION
Somnolence and sedation  Somnolence and sedation may occur, predominantly during the first 2-3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

Overdose
Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

CONCEPTION AND CONTRACEPTION
Manufacturer recommends effective contraception in females of childbearing potential.

PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC FEEDING
Manufacturer advises consider dose reduction.

RENAL IMPAIRMENT
Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.

MONITORING REQUIREMENTS
Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and...
then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.

- Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.

### TREATMENT CESSATION

Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

### DIRECTIONS FOR ADMINISTRATION

Manufacturer advises avoid administration with high fat meals (may increase absorption).

### PATIENT AND CARER ADVICE

Patients or carers should be counselled on administration of guanfacine modified-release tablets.

#### Missed doses

Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.

#### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS** 25, 2

- **Guanfacine** (as Guanfacine hydrochloride) 1 mg Intuniv 1mg modified-release tablets | 28 tablet **POD** £6.00
- **Guanfacine** (as Guanfacine hydrochloride) 2 mg Intuniv 2mg modified-release tablets | 28 tablet **POD** £8.52
- **Guanfacine** (as Guanfacine hydrochloride) 3 mg Intuniv 3mg modified-release tablets | 28 tablet **POD** £10.47
- **Guanfacine** (as Guanfacine hydrochloride) 4 mg Intuniv 4mg modified-release tablets | 28 tablet **POD** £16.16

## 2.2 Bipolar disorder and mania

### Drugs for mania and hypomania

#### Overview

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

#### Benzodiazepines

Use of benzodiazepines may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

#### Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 242, quetiapine p. 243, or risperidone p. 244) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Atypical antipsychotics are the treatment of choice for the long-term management of bipolar disorder in children and adolescents; if the patient has frequent relapses or continuing functional impairment, consider concomitant therapy with lithium or valproate. An atypical antipsychotic that causes less weight gain and does not increase prolactin levels is preferred.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the child is continuing on other antimanic drugs; if the child is not continuing on other antimanic drugs, or has a history of manic relapse, a withdrawal period of up to 3 months is required.

#### Carbamazepine

Carbamazepine p. 189 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in children unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

### Valproate

Valproic acid p. 205 (as the semisodium salt) is licensed in adults for the treatment of manic episodes associated with bipolar disorder. Sodium valproate p. 200 is unlicensed for the treatment of bipolar disorder. Valproate (valproic acid and sodium valproate) can also be used for the prophylaxis of bipolar disorder [unlicensed use]. It must be started and supervised by a specialist experienced in managing bipolar disorder.

Valproate (valproic acid and sodium valproate) should not be used in female children, in females of childbearing potential and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and risks of valproate therapy should be carefully reconsidered at regular treatment reviews. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or an atypical antipsychotic, or adding lithium or an atypical antipsychotic to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

#### Lithium

Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder ( manic-depressive disorder), and bipolar depression, and as concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder [unlicensed indication]. It is also used for the treatment of aggressive or self-harming behaviour [unlicensed indication]. The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual child, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. An atypical antipsychotic or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.
**CONTRA-INDICATIONS** Addison’s disease · cardiac insufficiency · dehydration · family history of Brugada syndrome · low sodium diets · personal history of Brugada syndrome · rhythm disorder · untreated hypothyroidism

**CAUTIONS** Avoid abrupt withdrawal · cardiac disease · concurrent ECT (risk of toxicity) · epilepsy (may lower seizure threshold) · myasthenia gravis · psoriasis (risk of exacerbation) · QT interval prolongation · review dose as necessary in diarrhoea · review dose as necessary in intercurrent infection (especially if sweating profusely) · review dose as necessary in vomiting · surgery

**SIDE-EFFECTS**
- Very rare · Nystagmus
- Frequency not known · Acneiform eruptions · alopecia · anorexia · arrhythmia · arthralgia · AV block · benign intracranial hypertension · bradycardia · cardiomyopathy · cognitive impairment · dry mouth · dysgeusia · ECG changes · electrolyte imbalance · encephalopathy · euthyroid goitre · extrapyramidal side-effects · fine tremor · gastritis · gastro-intestinal disturbances · hallucinations · hyperparathyroidism · hypersalivation · hyperthyroidism · hypothyroidism · kidney changes · leucocytosis · malaise · memory loss · myalgia · myasthenia gravis · nephrogenic diabetes insipidus · nephrotic syndrome · oedema · other skin disorders · parathyroid adenoma · peripheral neuropathy · polydipsia · psoriasis · sickness exacerbation · QT interval prolongation · Raynaud’s phenomena · renal impairment · sexual dysfunction · sinus node dysfunction · speech disorder · thyroid changes · vertigo · weight changes

**OVERDOSE** Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hyperatraemia. With severe overdosage seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 803.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.

**PREGNANCY** Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal). Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).

Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

**BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.

**RENAI IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment. In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

**MONITORING REQUIREMENTS**
- Serum concentrations. Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.

Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.

Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.

- Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).

- Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.

**TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

**PATIENT AND CARER ADVICE**
Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance).

- Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

**Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving, operating machinery).

Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from

Lithium carbonate

INDICATIONS AND DOSE

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

BY MOUTH

Child 12-17 years: Initially 225–675 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® IMMEDIATE-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of aggressive or self-harming behaviour

BY MOUTH

Child 12-17 years: Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

BY MOUTH

Child 12-17 years: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® MODIFIED-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of aggressive or self-harming behaviour

BY MOUTH

Child 12-17 years: Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

BY MOUTH

Child 12-17 years: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

UNLICENSED USE
Not licensed for aggressive or self-harming behaviour. Not licensed for concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder. Camcolit® brand not licensed for use in children.

INTERACTIONS
Appendix 1: lithium

2.3 Depression

Antidepressant drugs

**Overview**

Depression in children should be managed by an appropriate specialist and treatment should involve psychological therapy.

**Choice**

The major classes of antidepressant drugs include the tricyclics and related antidepressant drugs, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in children with a history of moderate or severe depression.

Choice of antidepressant drug should be based on the individual child’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy.

When drug treatment of depression is considered necessary in children, the SSRIs should be considered first-line treatment; following a safety and efficacy review, fluoxetine p. 228 is licensed to treat depression in children.

Tricyclic antidepressant drugs should be avoided for the treatment of depression in children.

**St John’s wort (Hypericum perforatum)** is a popular herbal remedy on sale to the public for treating mild depression in adults. It should not be used for the treatment of depression in children because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a child stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

**Management**

Children should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks. Following remission, antidepressant treatment should be continued at the same dose for at least 6 months. Children with a history of recurrent depression should continue treatment for at least 2 years.

**Hyponatraemia and antidepressant therapy**

Hyponatraemia (possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressant drugs. Hyponatraemia should be considered in all children who...
Serotonin syndrome
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diaphoresis), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Important safety information: Depressive illness in children and adolescents
The balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment. Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

Anxiety
Management of acute anxiety in children with drug treatment is contentious. For chronic anxiety (of longer than 4 weeks’ duration), it may be appropriate to use an antidepressant drug before a benzodiazepine.

Tricyclic antidepressants are not effective for treating depression in children.

Some tricyclic antidepressant drugs may have a role in some forms of neuralgia, and in nocturnal enuresis in children.

Dosage
It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment.

In most children the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Other drugs used for Depression
- Lithium carbonate, p. 225
- Lithium citrate, p. 226

Selective serotonin re-uptake inhibitors

- Drug action
  - Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
  
- Contra-indications
  - Poorly controlled epilepsy
  - SSRIs should not be used if the patient enters a manic phase.
  
- Caution
  - Cardiac disease
  - Concurrent electroconvulsive therapy
  - Diabetes mellitus
  - Epilepsy (discontinue if convulsions develop)
  - History of bleeding disorders
  - Especially gastro-intestinal bleeding
  - History of mania
  - Susceptibility to angle-closure glaucoma

- Side-effects
  - Common or very common
    - Abdominal pain (dose-related)
    - Constipation (dose-related)
    - Diarrhoea (dose-related)
    - Dyspepsia (dose-related)
    - Gastro-intestinal effects (dose-related)
    - Nausea (dose-related)
    - Vomiting (dose-related)
  
- Uncommon
  - Serotonin syndrome
  - Very rare
    - Angle-closure glaucoma

- Frequency not known
  - Anaphylaxis
  - Angioedema
  - Anorexia
  - Weight loss
  - Arthralgia
  - Asthenia
  - Bleeding disorders
  - Convulsions
  - Dizziness
  - Drowsiness
  - Dry mouth
  - Dyskinesias
  - Ecchymoses
  - Galactorrhoea
  - Hallucinations
  - Headache
  - Hypersensitivity reactions
  - Hyponatraemia
  - Increased appetite
  - Insomnia
  - Mania
  - Movement disorders
  - Myalgia
  - Nervousness
  - Photosensitivity
  - Purpura
  - Rash
  - Sexual dysfunction
  - Suicidal behaviour
  - Sweating
  - Tremor
  - Urinary retention
  - Urticaria
  - Visual disturbances
  - Weight gain

- Side-effects, further information
  - Hypersensitivity reactions
    - If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

Overdose
Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nästagnus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 803.

Pregnancy
Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

Treatment Cessation
Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitiation and visual disturbances may occur less
commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
May also impair performance of skilled tasks (e.g. driving, operating machinery).

---

### Citalopram

#### INDICATIONS AND DOSE

**Major depression**

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: Initially 10 mg once daily, increased if necessary to 20 mg once daily, dose to be increased over 2–4 weeks; maximum 40 mg per day

- **BY MOUTH USING ORAL DROPS**
  - Child 12-17 years: Initially 8 mg once daily, increased if necessary to 16 mg once daily, dose to be increased over 2–4 weeks; maximum 32 mg per day

**DOSE EQUIVALENCE AND CONVERSION**

- 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

#### UNLICENSED USE

Not licensed for use in children.

#### CONTRA-INDICATIONS

- QT-interval prolongation

#### CAUTIONS

- Susceptibility to QT-interval prolongation

#### INTERACTIONS

- Appendix 1: SSRIs

#### SIDE-EFFECTS

- Taste disturbance, abnormal dreams, aggression, amnesia, bradycardia, confusion, coughing, euphoria, haemorrhage, hepatitis, hypokalaemia, impaired concentration, increased salivation, malaise, micturition disorders, migraine, mydriasis, oedema, palpitation, paraesthesia, polyuria, postural hypotension, pruritus, QT-interval prolongation, rhinitis, tachycardia, tinnitus, yawning

#### BREAST FEEDING

Present in milk—use with caution.

#### HEPATIC IMPAIRMENT

Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.

#### RENAL IMPAIRMENT

No information available for estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

#### DIRECTIONS FOR ADMINISTRATION

*Cipramil®* oral drops should be mixed with water, orange juice, or apple juice before taking.

#### PATIENT AND CARER ADVICE

Driving and skilled tasks
Patients should be advised of the effects of citalopram on driving and skilled tasks.

Counselling on administration of oral drops is advised.

---

### Fluoxetine

#### INDICATIONS AND DOSE

**Major depression**

- **BY MOUTH**
  - Child 8-17 years: Initially 10 mg daily, increased if necessary up to 20 mg daily, dose to be increased after 1–2 weeks of initial dose, daily dose may be administered as a single or divided dose

**PHARMACOKINETICS**

Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

#### INTERACTIONS

- Appendix 1: SSRIs

#### SIDE-EFFECTS

- Aloppecia, changes in blood sugar, chills, confusion, dysphagia, dyspnoea, euphoria, flushing, haemorrhage, hepatitis, hypotension, impaired concentration, malaise, neuroleptic malignant syndrome-like event, palpitation, pharyngitis, priapism, pulmonary fibrosis, pulmonary inflammation, sleep disturbances, taste disturbance, toxic epidermal necrolysis, urinary frequency, vasodilatation, yawning

#### BREAST FEEDING

Present in milk—avoid.

#### HEPATIC IMPAIRMENT

Reduce dose or increase dose interval.

#### DIRECTIONS FOR ADMINISTRATION

Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

#### PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of dispersible tablets.

Driving and skilled tasks
Patients should be counselled about the effects on driving and skilled tasks.

Medicines for Children leaflet: Fluoxetine for depression, obsessive compulsive disorder and bulimia nervosa

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- Olena (AMCo)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20mg dispersible tablets sugar-free | 28 tablet PhOx £3.44 DT price = £3.44
Fluvoxamine maleate

**INDICATIONS AND DOSE**

**Obsessive-compulsive disorder**
- **BY MOUTH**
  - Child 8–17 years: Initially 25 mg daily, then increased in steps of 25 mg every 4–7 days (max. per dose 100 mg twice daily) if required, dose to be increased according to response, doses above 50 mg should be given in 2 divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered.

**INTERACTIONS** → Appendix 1: SSRIs

**SIDE-EFFECTS**
- Common or very common Malaise · palpitation · tachycardia
- Uncommon Ataxia · confusion · postural hypotension
- Rare Abnormal liver function, usually symptomatic (discontinue treatment)
- Frequency not known Neuroleptic malignant syndrome-like effect · paraesthesia · taste disturbance

**BREAST FEEDING** Present in milk—avoid.

**HEPATIC IMPAIRMENT** Start with low dose.

**RENAL IMPAIRMENT** Start with low dose.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients should be counselled on the effects on driving and skilled tasks.

Medicines for Children leaflet: Sertraline for OCD (obsessive compulsive disorder) and depression. ---

**Sertraline**

**Indications and dose**

**Obsessive-compulsive disorder**
- **By mouth**
  - Child 6–11 years: Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day
  - Child 12–17 years: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

**Major depression**
- **By mouth**
  - Child 12–17 years: Initially 50 mg once daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

---

**Amitriptyline hydrochloride**

**Indications and dose**

**Depressive illness** (not recommended—increased risk of fatality in overdose)
- **By mouth**
  - Child 16–17 years: Initially 10–25 mg 3 times a day, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually continued →
Neuropathic pain

- **BY MOUTH**
  - Child 2–11 years: Initially 200–500 micrograms/kg once daily (max. per dose 10 mg), dose to be taken at night, increased if necessary up to 1 mg/kg twice daily, to be given on specialist advice
  - Child 12–17 years: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

- **UNLICENSED USE** Not licensed for use in neuropathic pain.

- **CONTRA-INDICATIONS** Acute porphyrias p. 577. Arrhythmias - during manic phase of bipolar disorder - heart block

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - fatigue - hypertension - mydriasis - oedema - palpitation - restlessness - stomatitis
  - **Rare** Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor
  - **Very rare** Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma
  - **Frequency not known** Agitation - alopecia - anorexia - anxiety - arrhythmias - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - ECG changes - galactorrhea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hyponatraemia - increased appetite - increased intra-ocular pressure - influenza-like symptoms (on withdrawal) - Insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nauseas (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**Overdose**

Overdose with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdose may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 803.

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
  - Medicines for Children leaflet: Amitriptyline for neuropathic pain www.medicinesforchildren.org.uk/amitriptyline-for-neuropathic-pain

- **LESS SUITABLE FOR PRESCRIBING** Amitriptyline hydrochloride is less suitable for prescribing, see Antidepressant drugs p. 226.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS** 2
  - **Amitriptyline hydrochloride (Non-proprietary)**
    - Amitriptyline hydrochloride 2 mg per 1 ml Amitriptyline 10mg/5ml oral solution sugar-free sugar-free | 150 ml (PoM) £12.76 DT price = £14.57
    - Amitriptyline hydrochloride 5 mg per 1 ml Amitriptyline 25mg/5ml oral solution sugar-free sugar-free | 150 ml (PoM) £18.00 DT price = £18.00
    - Amitriptyline hydrochloride 10 mg per 1 ml Amitriptyline 50mg/5ml oral solution sugar-free sugar-free | 150 ml (PoM) £19.20 DT price = £19.20

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 2
  - **Amitriptyline hydrochloride (Non-proprietary)**
    - Amitriptyline hydrochloride 10 mg Amitriptyline 10mg tablets | 28 tablet (PoM) £1.12 DT price = £1.09
    - Amitriptyline hydrochloride 25 mg Amitriptyline 25mg tablets | 28 tablet (PoM) £1.13 DT price = £0.79
    - Amitriptyline hydrochloride 50 mg Amitriptyline 50mg tablets | 28 tablet (PoM) £5.99 DT price = £2.77

**Doxepin**

- **INDICATIONS AND DOSE**
  - **Depressive illness (particularly where sedation is required)**
    - **BY MOUTH**
      - Child 12–17 years: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to be taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 577. Arrhythmias - during manic phase of bipolar disorder - heart block

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention
CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

INTERACTIONS
Appendix 1: tricyclic antidepressants

SIDE-EFFECTS

Common or very common
Agitation • anxiety • confusion • dizziness • drowsiness • irritability • paraesthesia • sleep disturbances

Rare
Dysarthria • extrapyramidal symptoms • paralytic ileus • tremor

Very rare
Neuroleptic malignant syndrome • precipitation of angle-closure glaucoma

Frequency not known
Abdominal pain • alopecia • anorexia • arrhythmia • blurred vision • breast enlargement • changes in blood sugar • constipation • convulsions • delusions • diarrhoea • dry mouth • flushing • galactorrhoea • gynaecomastia • haematological reactions • hallucinations • headache (on withdrawal) • heart block • hepatic reactions • hypomania • hyponatraemia • increased appetite • influenza-like symptoms (on withdrawal) • insomnia (on withdrawal) • mania • movement disorders (on withdrawal) • myalgia (on withdrawal) • nausea • nausea (on withdrawal) • oedema • photosensitivity • pruritus • rash • sexual dysfunction • stomatitis • sudden death of patients with cardiac disease • suicidal behaviour • sweating • sweating (on withdrawal) • taste disturbance • tinnitus • urinary retention • urticaria • vivid dreams (on withdrawal) • vomiting • weight gain • weight loss

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 803.

PREGNANCY
Use with caution—limited information available.

BRASSE FEEDING
The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

HEPATIC IMPAIRMENT
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENAI IMPAIRMENT
Use with caution.

TREATMENT CESSATION
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS

Indications and dose

Nocturnal enuresis

BY MOUTH

Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Attention deficit hyperactivity disorder (under expert supervision)

BY MOUTH

Child 6–17 years: 10–30 mg twice daily

UNLICENCED USE
Not licensed for use for attention deficit hyperactivity disorder.

CONTRA-INDICATIONS
Acute porphyrias p. 577 • arrhythmia • during the manic phase of bipolar disorder • heart block

CAUTIONS
Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • susceptibility to angle-closure glaucoma • urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

INTERACTIONS
Appendix 1: tricyclic antidepressants

SIDE-EFFECTS

Common or very common
Fatigue • flushing • headache • palpitation • restlessness

Rare
Extrapyramidal symptoms • paralytic ileus

Very rare
Abdominal pain • aggression • allergic alveolitis • cardiac decompensation • diarrhoea • hypertension • mydriasis • myoclonus • neuroleptic malignant syndrome • oedema • peripheral vasospasm • precipitation of angle-closure glaucoma • stomatitis

Frequency not known
Agitation • alopecia • anorexia • anxiety • arrhythmia • blurred vision • breast enlargement • changes in blood sugar • chills (on withdrawal) • confusion • constipation • convulsions • delusions • dizziness • drowsiness • dry mouth • dystarthis • ECG changes • galactorrhoea • gynaecomastia • haematological reactions • hallucinations • headache (on withdrawal) • heart block • hepatic reactions • hypomania • hyponatraemia • increased

Imprompine hydrochloride

INDICATIONS AND DOSE

Nocturnal enuresis

BY MOUTH

Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Attention deficit hyperactivity disorder (under expert supervision)

BY MOUTH

Child 6–17 years: 10–30 mg twice daily

UNLICENCED USE
Not licensed for use for attention deficit hyperactivity disorder.

CONTRA-INDICATIONS

apetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

**Overdose**
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 803.

### PREGNANCY
Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal symptoms reported in neonates when used in the third trimester.

### BREAST FEEDING
The amount secreted into breast milk is too small to be harmful.

### HEPATIC IMPAIRMENT
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

### RENAL IMPAIRMENT
Use with caution in severe impairment.

### TREATMENT CESSATION
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.

### PRESCRIBING AND DISPENSING INFORMATION
Limited quantities of tricyclic antidepressants should be prescribed at any time because their cardiovascular and epileptogenic effects are dangerous in overdose.

### PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

### Nortriptyline

**INDICATIONS AND DOSE**

- **Depressive illness**
  - **BY MOUTH**
  - Child 12-17 years: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses, alternatively increased if necessary to 30–50 mg once daily; maximum 150 mg per day

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 577 · arrhythmias · during the manic phase of bipolar disorder · heart block

- **CAUTIONS**
  - Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · susceptibility to angle-closure glaucoma · urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase.

**INTERACTIONS**

Appendix 1: tricyclic antidepressants

**SIDE-EFFECTS**

- Common or very common Fatigue · hypertension · mydriasis · restlessness
- Rare Extrapyramidal symptoms · paralytic ileus
- Very rare Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma

**Frequency not known**

- Abdominal pain · agitation · alopecia · anorexia · anxiety · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · ECG changes · flushing · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · oedema · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · stomatitis · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

**Overdose**
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 803.

**PREGNANCY**
Use only if potential benefit outweighs risk.

**BREAST FEEDING**
The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT**
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**MONITORING REQUIREMENTS**
Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.

**TREATMENT CESSATION**
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some
cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **Prescribing and dispensing information** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **Patient and carer advice** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### 2.4 Psychoses and schizophrenia

**Psychoses and related disorders**

**Advice on doses of antipsychotic drugs above BNF for Children upper limit**

- Consider alternative approaches including adjuvant therapy.
- Bear in mind risk factors, including obesity. Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important:** When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the child is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

**Antipsychotic drugs**

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs on the developing nervous system. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’. In the short term they are used to calm disturbed children whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

**Schizophrenia**

The aim of treatment is to alleviate the suffering of the child (and carer) and to improve social and cognitive functioning. Many children require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Children with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a child with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

**First-generation antipsychotic drugs**

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 236, levomepromazine p. 257, and promazine hydrochloride, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** pericyazine p. 240, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** perphenazine p. 238, prochlorperazine p. 258, and trifluoperazine p. 239, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (e.g. haloperidol p. 237) resemble the group 3 phenothiazines in their clinical properties.

**Diphenylbutylpiperidines** (pimozide p. 238) and the **substituted benzamides** ( sulphiride p. 244) have reduced sedative, antimuscarinic, and extrapyramidal effects.

**Second-generation antipsychotic drugs**

The second-generation antipsychotic drugs (also referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

**Prescribing of antipsychotic drugs in children with learning disabilities**

When prescribing for children with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account (Eve):
Mental health disorders

Nervous system

Bone mineral density, menstrual disturbances, breast hyperprolactinaemia. The clinical symptoms of drugs are most likely to cause symptomatic Risperidone, amisulpride, and dopamine inhibits prolactin release. Aripiprazole reduces increase prolactin concentration to some extent because antimuscarinic effects can cause disorders of arousal; and more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha2-adrenergic receptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Cardiovascular side-effects

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperprolactinaemia and weight gain

Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain. Olanzapine is associated with more weight gain than other second generation antipsychotic drugs. Weight gain happens soon after treatment with olanzapine has started.

Hypotension and interference with temperature regulation

Hypotension and interference with temperature regulation are dose-related side-effects. Clozapine, chlorpromazine, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some children.

Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

Choice

The antipsychotic drugs most commonly used in children are haloperidol p. 237, risperidone p. 244, and olanzapine p. 242. There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 241), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all children. Choice of antipsychotic medication is influenced by the child’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects

Second-generation antipsychotic drugs may be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 240, clozapine, olanzapine, and quetiapine p. 243 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 239 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine

Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- parkinsonian symptoms (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- dystonia (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and appear after only a few doses;
- akathisia (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- tardive dyskinesia (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Hyperprolactinaemia

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine–receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

Sexual dysfunction

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic–induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects

Second-generation antipsychotic drugs may be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 240, clozapine, olanzapine, and quetiapine p. 243 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 239 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine
receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

**QT interval**
Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, olanzapine, perphenazine p. 238, risperidone, and sulpiride p. 244.

**Diabetes**
Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in children with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, haloperidol has the lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride, and trifluoperazine p. 239 are least likely to cause weight gain.

**Sexual dysfunction and prolactin**
The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Children should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is used for the treatment of schizophrenia in children unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Children must be registered with a clozapine patient monitoring service.

**Monitoring**
Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the child is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

**Other uses**
Nausea and vomiting, choreas, motor tics, and intractable hiccup.

**Equivalent doses of oral antipsychotics**
These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; children should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

**Dosage**
After an initial period of stabilisation, the total daily oral dose of antipsychotic drugs can be given as a single dose in most children.

**Antipsychotic depot injections**
There is limited information on the use of antipsychotic depot injections in children and use should be restricted to specialist centres.

## Antipsychotics

### Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · diabetes (may raise blood glucose) · epilepsy · history of jaundice · myasthenia gravis · photosensitisation (may occur with higher dosages) · severe respiratory disease · susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

- **Cardiovascular disease** An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

- **SIDE-EFFECTS**

- **Rare** Neuroleptic malignant syndrome—discontinue (potentially fatal)

- **Very rare** Precipitation of angle-closure glaucoma

- **Frequency not known** Agitation · agranulocytosis · akathisia · antimuscarinic symptoms · apathy · blood dyscrasias · blurred vision · cardiovascular side-effects · confusion · constipation · contact sensitisation · convulsions · corneal and lens opacities · diabetes · difficulty with micturition · dizziness · drowsiness · dry mouth · dystonia · excitement · extrapyramidal symptoms · gastro-intestinal disturbances · headache · hyperglycaemia · hyperprolactinemia · hypotension (dose related) · insomnia · interference with temperature regulation (dose related) · jaundice (including cholestatic) · leucopenia · nasal congestion · parkinsonian symptoms · photosensitisation · purpural pigmentatio of the conjunctiva · purpural pigmentation of the cornea · purpural pigmentation of the retina · photosensitisation (may occur with higher dosages) · purum pigmentation of the skin · rash · sexual dysfunction · tardive dyskinesia · venous thromboembolism · weight gain

**Overdose**
Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 803.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should
be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

- **MONITORING REQUIREMENTS**
  - It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
  - Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
  - Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

- **PATIENT AND CARER ADVICE**
  As photosensitivity may occur with higher dosages, patients should avoid direct sunlight.

  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

### ANTIPSYCHOTICS \(\Rightarrow\) FIRST-GENERATION

#### Chlorpromazine hydrochloride

- **INDICATIONS AND DOSE**
  - **Childhood schizophrenia and other psychoses (under expert supervision)**
    - **BY MOUTH**
      - Child 1–5 years: 500 micrograms/kg every 4–6 hours, adjusted according to response; maximum 40 mg per day
      - Child 6–11 years: 10 mg 3 times a day, adjusted according to response; maximum 75 mg per day
      - Child 12–17 years: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
      - Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
      - Child 12–17 years: 25–50 mg every 6–8 hours

#### Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

- **BY MOUTH**
  - Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
  - Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
  - Child 12–17 years: 10–25 mg every 4–6 hours
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
  - Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
  - Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose adjustment may be necessary if smoking started or stopped during treatment.

#### DOSE EQUIVALENCE AND CONVERSION

- For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository \(\equiv\) 20–25 mg chlorpromazine hydrochloride by intramuscular injection \(\equiv\) 40–50 mg of chlorpromazine base or hydrochloride given by mouth.

- **CONTRA-INDICATIONS** CNS depression • comatose states • hypothyroidism • phaeochromocytoma

- **INTERACTIONS** \(\rightarrow\) Appendix 1: phenothiazines

- **SIDE-EFFECTS**
  - **SIDE-EFFECTS, FURTHER INFORMATION**

    - Acute dystonic reactions Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

    - **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

    - **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

    - **MONITORING REQUIREMENTS**
      - Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

    - **HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Haloperidol

INDICATIONS AND DOSE

Schizophrenia (under expert supervision)
- **BY MOUTH**
  - Child 3-12 years: Initially 250 micrograms daily in 2–3 divided doses; usual dose 0.5–3 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 3 mg per day
  - Child 13-17 years: Initially 500 micrograms daily in 2–3 divided doses; usual dose 1–6 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 10 mg per day

Childhood behavioural disorders, especially when associated with hyperactivity and aggression (under expert supervision) | Gilles de la Tourette syndrome (under expert supervision)
- **BY MOUTH**
  - Child 3-12 years: Initially 250 micrograms daily in 2–3 divided doses; usual dose 0.5–3 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 3 mg per day

Nausea and vomiting in palliative care
- **BY MOUTH**
  - Child 12-17 years: 1.5 mg once daily, dose to be taken at night, increased if necessary to 1.5 mg twice daily (max. per dose 5 mg twice daily)

Restlessness and confusion in palliative care
- **BY MOUTH**
  - Child 1-7 years: 10–20 micrograms/kg every 8–12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Dose adjustment may be necessary if smoking started or stopped during treatment.

UNLICENSED USE
Not licensed for use in children for nausea and vomiting in palliative care.

IMPORTANT SAFETY INFORMATION
When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

CONTRA-INDICATIONS
Bradydyskinesia • CNS depression • comatosed states • lesions of the basal ganglia • phaeochromocytoma • QT-interval prolongation

CAUTIONS
Hypocalcaemia • hypokalaemia • hypomagnesaemia • metabolic disturbances • subarachnoid haemorrhage

INTERACTIONS
- Appendix 1: haloperidol

SIDE-EFFECTS
- Common or very common: Depression • weight loss
- Uncommon: Dyspnoea • oedema

RARE
Bronchospasm • hypoglycaemia • inappropriate antidiuretic hormone secretion

FREQUENCY UNKNOWN
Stevens-Johnson syndrome • toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Less sedating and fewer antimuscarinic or hypotensive symptoms.

PREGNANCY
Avoid unless benefits outweigh risks.

HEPATIC IMPAIRMENT
Can precipitate coma.

RENAL IMPAIRMENT
Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

PRESCRIBING AND DISPENSING INFORMATION
Palliative care
For further information on the use of haloperidol in palliative care, see www.palliativedrugs.com/formulary/en/haloperidol.html.

Pericyazine

INDICATIONS AND DOSE
Schizophrenia (under expert supervision) • Psychoses (severe mental or behavioural disorders only) (under expert supervision)
- **BY MOUTH**
  - Child 1-11 years: Initially 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose; maximum 10 mg per day continued →
→ Avoid in renal impairment.
→ Not licensed for use in Tourette syndrome.

Start with small doses in severe renal impairment:

- Initial dose 0.1 mg/kg/day divided doses.
- Adjust according to response, in steps of 0.1 mg/kg/day.
- Total daily dose may be increased up to 1 mg/kg/day.

Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- Can precipitate coma;
- Phenothiazines are hepatotoxic.

- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

### Pimozide

#### INDICATIONS AND DOSE

**Schizophrenia**

- **BY MOUTH**
- Child 12-17 years (under expert supervision): Initially 1 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

**Tourette syndrome (under expert supervision)**

- **BY MOUTH**
- Child 2-11 years: 1–4 mg daily
- Child 12-17 years: 2–10 mg daily

### Sulpiride

#### INDICATIONS AND DOSE

**Schizophrenia with predominantly negative symptoms**

- **BY MOUTH**
- Child 14-17 years (under expert supervision): 200–400 mg twice daily; maximum 800 mg per day
Schizophrenia with mainly positive symptoms

- **BY MOUTH**
  - Child 14-17 years (under expert supervision): 200–400 mg twice daily; maximum 2.4 g per day

Tourette syndrome (under expert supervision)

- **BY MOUTH**
  - Child 2-11 years: 50–400 mg twice daily
  - Child 12-17 years: 100–400 mg twice daily

- **UNLICENSED USE** Not licensed for use in Tourette syndrome.
- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) - agitated patients (even low doses may aggravate symptoms) - excited patients (even low doses may aggravate symptoms)
- **INTERACTIONS** → Appendix 1: sulpiride
- **SIDE-EFFECTS** Anorexia · dysthymic reactions · muscle weakness
  
  **SIDE-EFFECTS, FURTHER INFORMATION** Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily. Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.

  **Trifluoperazine**

  - **INDICATIONS AND DOSE**

    Schizophrenia and other psychoses · Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

    - **BY MOUTH**
      - Child 12-17 years (under expert supervision): Initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response

    Short-term adjunctive management of severe anxiety

    - **BY MOUTH**
      - Child 3-5 years (under expert supervision): Up to 500 micrograms twice daily
      - Child 6-11 years (under expert supervision): Up to 2 mg twice daily

  - **Child 12-17 years (under expert supervision): 1–2 mg twice daily, increased if necessary to 3 mg twice daily**

  **Severe nausea and vomiting unresponsive to other antiemetics**

  - **BY MOUTH**
    - Child 3-5 years: Up to 500 micrograms twice daily
    - Child 6-11 years: Up to 2 mg twice daily
    - Child 12-17 years: 1–2 mg twice daily (max. per dose 3 mg twice daily)

  - **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

  - **INTERACTIONS** → Appendix 1: phenothiazines

  - **SIDE-EFFECTS** Anorexia · dysthymic reactions · muscle weakness

  **SIDE-EFFECTS, FURTHER INFORMATION** Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily. Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

  **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

  **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

  **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

  **Antipsychotics > Second-generation**

  - **Amisulpride**

  - **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D2 and D3 receptors.

  - **INDICATIONS AND DOSE**

    Acute psychotic episode in schizophrenia

    - **BY MOUTH**
      - Child 15-17 years (under expert supervision): 200–400 mg twice daily, adjusted according to response; maximum 1.2 g per day

    Schizophrenia with predominantly negative symptoms

    - **BY MOUTH**
      - Child 15-17 years (under expert supervision): 50–300 mg daily

  - **UNLICENSED USE** Not licensed for use in children.
CONTRA-INDICATIONS  CNS depression · comatose states ·
phaeochromocytoma · pre-pubertal children · prolactin-dependent tumours
INTERACTIONS → Appendix 1: amisulpride
SIDE-EFFECTS
Common or very common Anxiety
Uncommon Bradycardia
PREGNANCY Avoid.
BREAST FEEDING Avoid—no information available.
RENAL IMPAIRMENT Halve dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m². Use one-third dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². No information available if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
MONITORING REQUIREMENTS Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include caramel.

Aripiprazole 200 mg Solian 200 tablets | 60 tablet PoM £58.99 DT price = £5.44
Aripiprazole 400 mg Solian 400 tablets | 60 tablet PoM £117.97 DT price = £35.21

Aripiprazole

DRUG ACTION Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT₁A partial agonism and 5-HT₂A receptor antagonism.

INDICATIONS AND DOSE

Schizophrenia
BY MOUTH
Child 15–17 years (under expert supervision): Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, then increased in steps of 5 mg if required; maximum 30 mg per day

Treatment of mania (under expert supervision)
BY MOUTH
Child 13–17 years: Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, then increased in steps of 5 mg if required; maximum 30 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises double the dose with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children. Manufacturer advises reduce dose by half with concurrent use of potent inhibitors of CYP3A4 or CYP2D6—no specific recommendation made for children.

CONTRA-INDICATIONS  CNS depression · comatose state ·
phaeochromocytoma
CAUTIONS Cerebrovascular disease
INTERACTIONS → Appendix 1: aripiprazole
SIDE-EFFECTS
Common or very common Anxiety · hypersalivation · malaise
Uncommon Depression · dry mouth
Frequency not known Alopecia · anorexia · bradycardia · hepatitis · hyponatraemia · infection · laryngospasm · myalgia · oedema · oropharyngeal spasm · pancreatitis · pathological gambling · respiratory disorders · rhabdomyolysis · suicidal ideation · sweating · urinary disorders

SIDE-EFFECTS, FURTHER INFORMATION
Increased incidence of side-effects associated with doses of 30 mg daily; doses above 10 mg daily should only be used in exceptional cases and with close clinical monitoring.

PREGNANCY Use only if potential benefit outweighs risk.
BREAST FEEDING Manufacturer advises avoid—present in milk.
HEPATIC IMPAIRMENT Use with caution in severe impairment.
MONITORING REQUIREMENTS Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
DIRECTIONS FOR ADMINISTRATION Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets. Medicines for Children leaflet: Aripiprazole for schizophrenia, bipolar disorder and movement disorders

www.medicinesforchildren.org.uk/ariprazolo-schizophrenia-bipolar-disorder-and-movement-disorders

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
Aripiprazole for the treatment of schizophrenia in people aged 15 to 17 years (January 2011) Aripiprazole is recommended as an option for the treatment of schizophrenia in adolescents aged 15 to 17 years who have not responded adequately to, or who are intolerant of, risperidone, or for whom risperidone is contra-indicated.

www.nice.org.uk/TA213

Aripiprazole for the treatment of moderate to severe manic episodes in adolescents with bipolar I disorder (July 2013) Aripiprazole is recommended as an option for the treatment of moderate to severe manic episodes for up to 12 weeks in adolescents aged over 13 years with bipolar I disorder.

www.nice.org.uk/TA292
Susceptibility to angle-closure glaucoma

Clozapine is a dopamine D₄, dopamine D₆, 5-HT₂A, α₁, adrenergic, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

**DRUG ACTION**

Clozapine is a dopamine D₄, dopamine D₆, 5-HT₂A, α₁, adrenergic, and muscarinic-receptor antagonist.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**UNLICENSED USE**

Not licensed for use in children under 16 years.

**CONTRA-INDICATIONS**

Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy

**CAUTIONS**

Susceptibility to angle-closure glaucoma - taper off antipsychotics before starting

**UNLICENSED USE**

Not licensed for use in children under 16 years.

**CONTRA-INDICATIONS**

Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy

**CAUTIONS**

Susceptibility to angle-closure glaucoma - taper off antipsychotics before starting

**CAUTIONS, FURTHER INFORMATION**

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

**Myocarditis and cardiomyopathy**

Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- **Perform physical examination and take full medical history before starting**
- **Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk**
- **Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy**
- **If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist**
- **Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy**

**Intestinal obstruction**

Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

**INTERACTIONS**

Appendix 1: clozapine

**SIDE-EFFECTS**

- **Common or very common**
  - Anorexia
  - Constipation
  - Hypersalivation
  - Malaise
  - Speech disorders
  - Urinary incontinence
- **Uncommon**
  - Agranulocytosis
- **Rare**
  - Circulatory collapse
  - Dysphagia
  - Hepatitis
  - Myocarditis
  - Pancreatitis
  - Pericarditis
  - Pneumonia
  - Pulmonary aspiration
- **Very rare**
  - Cardiomyopathy
  - Hypercholesterolaemia
  - Hypertriglyceridaemia
  - Interstitial nephritis
  - Intestinal obstruction (including fatal cases)
  - Myocardial infarction

**ABILIFY® ORAL SOLUTION**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium, has advised (August 2013) that oral aripiprazole (Abilify®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe manic episodes in Bipolar I Disorder in adolescents aged 13 years and older for a period of up to 12 weeks. It is restricted to initiation and management under the supervision of a child/adolescent psychiatrist.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

obessive compulsive disorder • parotid gland enlargement • respiratory depression

Frequency not known  
Hepatic disorders • hepatic failure • muscle disorders • renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Hyposalivation  
Hyposalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

Pregnancy  
Use with caution.

Breast Feeding  
Avoid.

Hepatic Impairment  

Renal Impairment  
Avoid in severe impairment.

Monitoring Requirements  
Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 1 month, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.

Close medical supervision during initiation (risk of collapse because of hyponatremia and convulsions).

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

Treatment Cessation  
On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

Directions for Administration  
Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

Prescribing and Dispensing Information  
Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

Patient and Carer Advice  
Patients or carers should be given advice on how to administer clozapine oral suspension.

Medicinal Forms  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral Suspension  
CAUTIONARY AND ADVISORY LABELS 2, 10

Denzapine 50 mg per 1 ml  
Denzapine 50mg/ml oral suspension sugar-free  
100 ml  £30.60

Tablet  
CAUTIONARY AND ADVISORY LABELS 2, 10

Clozaril (Mylan Ltd)  
Clozapine 25 mg 25mg tablets  
28 tablet  £2.95  
84 tablet  £6.30 (Hospital only)  
100 tablet  £7.50 (Hospital only)

Clozapine 100 mg 100mg tablets  
28 tablet  £11.76  
84 tablet  £25.21 (Hospital only)  
100 tablet  £30.01 (Hospital only)

Denzapine (Britannia Pharmaceuticals Ltd)  
Clozapine 25 mg 25mg tablets  
84 tablet  £16.64  
100 tablet  £19.80

Olanzapine  
DRUG ACTION  
Olanzapine is a dopamine D1, D2, D3, 5-HT2, histamine-1, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE  
Schizophrenia • Combination therapy for mania

By Mouth  
Child 12–17 years (under expert supervision): Initially 5–10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monotherapy for mania

By Mouth  
Child 12–17 years (under expert supervision): 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Dose Adjustments Due to Interactions  
Dose adjustment may be necessary if smoking started or stopped during treatment.

Unlicensed Use  
Not licensed for use in children.

CAUTIONS  
Bone-marrow depression • diabetes mellitus (risk of exacerbation or ketoacidosis) • hypereosinophilic disorders • low leucocyte count • low neutrophil count • myeloproliferative disease • paralytic ileus

Interactions  
Appendix 1: olanzapine

Side-Effects  
Common or very common  
Arthralgia • hypercholesterolaemia • hypertriglyceridaemia • increased appetite • malaise • oedema

Uncommon  
Alopecia • amnesia • bradycardia • epistaxis

Rare  
Hepatitis • pancreatitis • rhabdomyolysis

Pregnancy  
Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

Breast Feeding  
Avoid—present in milk.

Hepatic Impairment  
Consider initial dose of 5 mg daily.

Renal Impairment  
Consider initial dose of 5 mg daily.

Monitoring Requirements  
Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

Directions for Administration  
Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.
PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer orodispersible tablets.

Quetiapine

DRUG ACTION
Quetiapine is a dopamine D<sub>2</sub>, dopamine D<sub>3</sub>, 5-HT<sub>2</sub>, alpha<sub>1</sub>, adrenergic receptor, and histamine-1 receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia

▶ By mouth using immediate-release medicines
- Child 12–17 years (under expert supervision): Initially 25 mg twice daily, adjusted according to response. adjusted in steps of 25–50 mg; maximum 750 mg per day.

Treatment of mania in bipolar disorder

▶ By mouth using immediate-release medicines
- Child 12–17 years (under expert supervision): Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily, usual dose 400–800 mg once daily; maximum 800 mg per day.

DOSE EQUIVALENCE AND CONVERSION

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

UNLICENSED USE
Not licensed for use in children.

CAUTIONS
Cerebrovascular disease - patients at risk of aspiration pneumonia. treatment of depression in patients under 25 years (increased risk of suicide).

INTERACTIONS
- Appendix 1: quetiapine

SIDE-EFFECTS
- Common or very common
  - Asthenia
  - Dysarthria
  - Dysphonia
  - Elevated plasma-cholesterol concentrations
  - Elevated plasma-triglyceride concentrations
  - Increased appetite
  - Irritability
  - Peripheral oedema
  - Sleep disorders

- Uncommon
  - Hyponatraemia

- Rare
  - Hepatitis
  - Pancreatitis

- Very rare
  - Angioedema
  - Inappropriate secretion of antidiuretic hormone
  - Rhabdomyolysis
  - Stevens-Johnson syndrome

FREQUENCY NOT KNOWN
- Suicidal behaviour (particularly on initiation) - toxic epidermal necrolysis

PREGNANCY
Use only if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid.

HEPATIC IMPAIRMENT
For immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg. For modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.
**Psyquet XL**

**Drug Information**

**Brand Name:** Psyquet XL

**Active Ingredient:** Quetiapine fumarate

**Dosage Form:** Tablets

**Pack Size:** 50 mg, 100 mg, 150 mg, 200 mg, 300 mg

**Pack Size:** 5, 10, 20, 50, 100

**Price Information:**
- 10 tablets: £24.60
- 20 tablets: £49.20
- 50 tablets: £98.50
- 100 tablets: £197.00

**Indications:**
- Acute and chronic psychosis
- Unlabelled use: Mania

**Drug Action:**
- Risperidone is a dopamine D2, 5-HT2A, alpha-1, adrenoceptor, and histamine-1 receptor antagonist.

**Indications and Dose**

**Acute and Chronic Psychosis**

**By Mouth**

- Child 12-17 years (under expert supervision): 2 mg daily in 1-2 divided doses for day 1, then 4 mg daily in 1-2 divided doses for day 2, slower titration is appropriate in some patients; usual dose 4-6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

**Short-term Monotherapy of Mania in Bipolar Disorder (under expert supervision)**

**By Mouth**

- Child 12-17 years: Initially 50 micrograms once daily, then adjusted in steps of 0.5-1 mg daily, adjusted according to response; usual dose 2.5 mg daily in 1-2 divided doses; maximum 6 mg per day
Short-term treatment (up to 6 weeks) of persistent agression in conduct disorder (under expert supervision)

- BY MOUTH
  - Child 5-17 years (body-weight up to 50 kg): Initially 250 micrograms once daily, then increased in steps of 250 micrograms once daily on alternate days, adjusted according to response; usual dose 500 micrograms once daily; maximum 750 micrograms per day
  - Child 5-17 years (body-weight 50 kg and above): Initially 500 micrograms once daily, then increased in steps of 50 micrograms once daily on alternate days, adjusted according to response; usual dose 1 mg once daily; maximum 1.5 mg per day

Short-term treatment of severe aggression in autism (under expert supervision)

- BY MOUTH
  - Child 5-17 years (body-weight 15-20 kg): Initially 250 micrograms daily for at least 4 days, then increased if necessary to 500 micrograms daily, then increased in steps of 250 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3-4 weeks; stop if no response at 6 weeks; maximum 1 mg per day
  - Child 5-17 years (body-weight 20-45 kg): Initially 500 micrograms daily for at least 4 days, then increased if necessary to 1 mg daily, then increased in steps of 50 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3-4 weeks; stop if no response at 6 weeks; maximum 2.5 mg per day
  - Child 5-17 years (body-weight 45 kg and above): Initially 500 micrograms daily for at least 4 days, then increased if necessary to 1 mg daily, then increased in steps of 500 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3-4 weeks; stop if no response at 6 weeks; maximum 3 mg per day

- UNLICENSED USE Not licensed for use in children for psychosis, mania, or autism.
- CAUTIONS Avoid in acute porphyrias p. 577 • cataract surgery (risk of intra-operative floppy iris syndrome) • dehydration • family history of sudden cardiac death (perform ECG) • prolactin-dependent tumours
- INTERACTIONS → Appendix 1: risperidone
- SIDE-EFFECTS
  - Common or very common Anxiety • appetite changes • arthralgia • depression • epistaxis • hypertension • infection • malaise • myalgia • oedema • respiratory disorders • sleep disorders • toothache • urinary disorders
  - Uncommon Alopecia • elevated plasma-cholesterol concentrations • elevated plasma-triglyceride concentrations • hypoesthesia • paraesthesia • taste disturbances • tinnitus • visual disorders
  - Rare Inappropriate antidiuretic hormone secretion • intestinal obstruction • intra-operative floppy iris syndrome • pancreatitis • pulmonary embolism • rhabdomyolysis
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Use only if potential benefit outweighs risk—small amount present in milk.
- HEPATIC IMPAIRMENT Initial and subsequent oral doses should be halved.
- RENAL IMPAIRMENT Initial and subsequent oral doses should be halved.
- DIRECTIONS FOR ADMINISTRATION Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.

- PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised). Medicines for Children leaflet: Risperidone for psychological disorders www.medicinesforchildren.org.uk/risperidone-for-psychological-disorders

- MEDICINAL FORMS

**Nervous system**
3 Movement disorders

3.1 Dystonias and other involuntary movements

Dystonias and related disorders

Dystonias

Dystonias may result from conditions such as cerebral palsy or may be related to a deficiency of the neurotransmitter dopamine as in Segawa syndrome.

Dopaminergic drugs used in dystonias

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitor most commonly used in children is carbidopa (in co-careldopa p. 247).

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual child.

In severe dystonias related to cerebral palsy, improvement can be expected within 2 weeks. Children with Segawa syndrome are particularly sensitive to levodopa; they may even become symptom free on small doses. Levodopa also has a role in treating metabolic disorders such as defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency. Tetrahydrobiopterin may have a role in metabolic disorders.

Children may experience nausea within 2 hours of taking a dose; nausea and vomiting with co-careldopa is rarely dose-limiting.

In dystonic cerebral palsy, treatment with larger doses of levodopa is associated with the development of potentially troublesome motor complications (including response fluctuations and dyskinesias). Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period.

Antimuscarinic drugs used in dystonias

The antimuscarinic drugs procyclidine hydrochloride below and trihexyphenidyl hydrochloride p. 247 reduce the symptoms of dystonias, including those induced by antipsychotic drugs; there is no justification for giving them routinely in the absence of dystonic symptoms. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

There are no important differences between the antimuscarinic drugs, but some children tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 212 can be given for life-threatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders

Haloperidol p. 237 can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 238
Trihexyphenidyl hydrochloride
(Benzhexol hydrochloride)

**DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

**Dystonia**

- **BY MOUTH**
  - Child 3 months–17 years: Initially 1–2 mg daily in 1–2 divided doses, then increased in steps of 1 mg every 3–7 days, dose to be adjusted according to response and side-effects; maximum 2 mg/kg per day

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Gastro-intestinal obstruction • myasthenia gravis

**CAUTIONS** Cardiovascular disease • hypertension • liable to abuse • psychotic disorders • pyrexia • those susceptible to angle-closure glaucoma

**INTERACTIONS** → Appendix 1: trihexyphenidyl

**SIDE-EFFECTS**

- Very rare: Angle-closure glaucoma

- Frequency not known: Anxiety • blurred vision • confusion • constipation • dizziness • dry mouth • euphoria • hallucinations • impaired memory • nausea • rash • restlessness • tachycardia • urinary retention • vomiting

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAI IMPAIRMENT** Use with caution.

**TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with or after food.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May affect performance of skilled tasks (e.g. driving).

Medicines for Children leaflet: Trihexyphenidyl hydrochloride for dystonia www.medicinesforchildren.org.uk/trihexyphenidyl-hydrochloride-for-dystonia

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**SOLUTION FOR INJECTION**

- **Trihexyphenidyl hydrochloride (Non-proprietary)**
  - **Solution for injection**
    - **Trihexyphenidyl hydrochloride 5 mg per 1 ml**
      - Procyclidine 10mg/2ml solution for injection ampoules | 5 ampoule (POM) £60.00–£78.75 DT price = £72.50

**ORAL SOLUTION**

- **Trihexyphenidyl hydrochloride (Non-proprietary)**
  - **Solution for injection**
    - **Trihexyphenidyl hydrochloride 1 mg per 1 ml**
      - Procyclidine 0.25mg/ml oral solution sugar-free | 150 ml (POM) £7.94–£8.22 DT price = £7.08

**TABLET**

- **Trihexyphenidyl hydrochloride (Non-proprietary)**
  - **Solution for injection**
    - **Trihexyphenidyl hydrochloride 1 mg per 1 ml**
      - Procyclidine 0.5mg/ml oral solution sugar-free | 150 ml (POM) £14.54–£14.72 DT price = £13.13

**CO-CARELEDOPA**

**DOPAMINE PRECURSORS**

**INDICATIONS AND DOSE**

Dopamine-sensitive dystonias including Segawa syndrome and dystonias related to cerebral palsy (dose expressed as levodopa)

- **BY MOUTH**
  - Child 3 months–17 years: Initially 250 micrograms/kg 2–3 times a day, dose to be increased according to response every 2–3 days, increased if necessary up to 1 mg/kg 3 times a day, preparation containing 1:4 ratio of carbidopa:levodopa is to be used

**TREATMENT OF DEFECTS IN TETRAHYDROBIOPHETIN SYNTHESIS AND DIHYDROBIOPHETIN REDUCTASE DEFICIENCY (DOSE EXPRESSED AS LEVODOPA)**

- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months).

  - Child: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months in early childhood)

**DOSE EQUIVALENCE AND CONVERSION**

- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
  - 2 tablets Sinemet® 12.5 mg/50 mg is equivalent to 1 tablet Sinemet® 25 plus 25 mg/100 mg.

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Cardiovascular disease • diabetes mellitus • history of myocardial infarction with residual arrhythmia • history of peptic ulcer • history of skin melanoma (risk of activation) • osteomalacia • psychiatric illness (avoid if severe and discontinue if deterioration) • pulmonary disease • susceptibility to angle-closure glaucoma

**INTERACTIONS** → Appendix 1: carbidopa, levodopa

**SIDE-EFFECTS**

- Common or very common: Agitation • anorexia • arrhythmias • dizziness • insomnia • nausea • postural hypotension • reddish discoloration of urine and other body fluids • tachycardia • vomiting
Rare Abnormal involuntary movements (may be dose-limiting) · Henoch–Schönlein purpura · hypersensitivity · labile hypertension · psychiatric symptoms (including hypomania, may be dose-limiting)

Very rare Angle-closure glaucoma

Frequency not known Depression · drowsiness · flushing · gastro-intestinal bleeding · headache · liver enzyme changes · peripheral neuropathy · pruritus · rash · sweating · syndrome resembling neuroleptic malignant syndrome (on withdrawal) · taste disturbance

Pregnancy Use with caution—toxicity has occurred in animal studies.

Breastfeeding May suppress lactation; present in milk—avoid.

Monitoring requirements In prolonged therapy, psychiatric, hepatic, haematological, renal, and cardiovascular monitoring is advisable; warn patients to resume normal activities gradually.

Effect on laboratory tests False positive tests for urinary ketones have been reported.

Treatment cessation Avoid abrupt withdrawal.

Prescribing and dispensing information Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

Patient and carer advice

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Warn patients to resume normal activity gradually.

National funding/access decisions

Duodopa®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2016) that Duodopa® intestinal gel is accepted for restricted use within NHS Scotland, within its licensed indication, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

Muscle relaxants > Peripherally acting > Neurotoxins (botulinum toxins)

Botulinum toxin type A

Indications and dose

Dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy

Child 2-17 years: (consult product literature)

Dose equivalence and conversion

Important: information is specific to each individual preparation.

Contra-indications

Generalised disorders of muscle activity · infection at injection site · myasthenia gravis

Caution

Atrophy in target muscle · chronic respiratory disorder · excessive weakness in target muscle · history of aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

Caution, further information

Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.
4 Nausea and labyrinth disorders

Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 79 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics.

Prochlorperazine p. 258, perphenazine p. 238, and trifluoperazine p. 239 are less sedating than chlorpromazine hydrochloride p. 236; severe dystonic reactions sometimes occur with phenothiazines. Some phenothiazines are available as rectal suppositories, which can be useful in children with persistent vomiting or with severe nausea; for children over 12 years prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 237 and levomepromazine p. 257 are used for the relief of nausea in palliative care.

Metoclopramide hydrochloride p. 252 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. Due to the risk of neurological side effects, metoclopramide hydrochloride should only be used in children as second line therapy in postoperative and cytotoxic-induced nausea and vomiting.

Domperidone p. 251 acts at the chemoceptor trigger zone; it has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier.

Granisetron p. 253 and ondansetron p. 253 are specific 5HT3-receptor antagonists which block 5HT3 receptors in the gastro-intestinal tract and in the CNS. They are of value in the management of nausea and vomiting in children receiving cytotoxics and in postoperative nausea and vomiting.

Nabilone p. 251 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Dexamethasone p. 419 has antiemetic effects. Dexamethasone may also have a role in cytotoxic-induced nausea and vomiting.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an
antihistamine, such as promethazine, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 601 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

**Postoperative nausea and vomiting**
The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk. Drugs used include 5HT3-receptor antagonists, droperidol p. 257, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

**Opioid-induced nausea and vomiting**
Cyclizine, ondansetron, and prochlorperazine are used to relieve opioid-induced nausea and vomiting; ondansetron has the advantage of not producing sedation.

**Motion sickness**
Antiemetics should be given to prevent motion sickness and vomiting. The incidence of motion sickness and vomiting is hyoscine hydrobromide p. 256. For children over 10 years old, a transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired, promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 255 is preferred. Domperidone, metoclopramide hydrochloride, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

**Other vestibular disorders**
Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are effective for prophylaxis and treatment of nausea and vertigo resulting from vestibular disorders; however, when nausea and vertigo are associated with middle ear surgery, treatment can be difficult.

**Cytotoxic chemotherapy, palliative care, and migraine**
Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

---

### Antiemetics and Anti-nausea Drugs

**Antihistamines**

- **Cyclizine**
  - **Indications and Dose**
    - *By mouth, or by intravenous injection*
      - Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day
        (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
      - Child 6-11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
      - Child 12-17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
    - *By rectum*
      - Child 2-5 years: 12.5 mg up to 3 times a day
      - Child 6-11 years: 25 mg up to 3 times a day
      - Child 12-17 years: 50 mg up to 3 times a day
    - *By continuous intravenous infusion, or by subcutaneous infusion*
      - Child 1-23 months: 3 mg/kg, dose to be given over 24 hours
      - Child 2-5 years: 50 mg, dose to be given over 24 hours
      - Child 6-11 years: 75 mg, dose to be given over 24 hours
      - Child 12-17 years: 150 mg, dose to be given over 24 hours
  - **Unlicensed use** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.
  - **Contra-indications** Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe) - neonate (due to significant antimuscarinic activity)
  - **Caution** Epilepsy - glaucoma - may counteract haemodynamic benefits of opioids - neuromuscular disorders - increased risk of transient paralysis with intravenous use - pyloroduodenal obstruction - severe heart failure - may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - urinary retention
  - **Interactions** → Appendix 1: antihistamines (sedating)
  - **Side-effects**
    - General side-effects
      - Common or very common: Drowsiness
      - Rare: Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - paradoxical stimulation (especially with high doses in children) - photosensitivity reactions - rashes - sleep disturbances - tremor
  - **Specific side-effects**
    - Rare
      - With intravenous use: Transient paralysis
    - Frequency not known
      - With subcutaneous use: Local irritation
    - **Side-effects, further information**
      - Children are more susceptible to side-effects.
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth*, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care is no evidence of teratogenicity. The use of sedating antihistamines is considerably less of a problem with the newer antihistamines although paradoxical stimulation is present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- Nabilone (Non-proprietary)

- Nabilone 250 microgram

- Nabilone 250 microgram capsules | 20 capsule POM £18.05 | D2

- Nabilone 1 mg capsule | 20 capsule POM £19.06 | D2

### ANTIEMETICS AND ANTIARRHCALEANTS

#### DOPAMINE RECEPTOR ANTAGONISTS

**Domperidone**

- **INDICATIONS AND DOSE**
  - **Relief of nausea and vomiting**
    - **BY MOUTH**
    - Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day
    - Child 12-17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

**Gastro-oesophageal reflux disease (but efficacy not proven)**

- **BY MOUTH**

- Neonate: 250 micrograms/kg 3 times a day, dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day, interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose.

- Child: 250 micrograms/kg 3 times a day (max. per dose 10 mg), dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day (max. per dose 20 mg), interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose.

- **UNLICENSED USE** Not licensed for use in children for gastro-oesophageal reflux disease.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of use are advised:
treatment have been made, and new contra-indications added:
- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);
- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
- The recommended dose in adults and adolescents over 12 years and over is 10 mg up to 3 times daily;
- The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.
This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

**CONTRA-INDICATIONS** Cardiac disease · gastro-intestinal haemorrhage · mechanical obstruction · mechanical perforation · predisposition to cardiac conduction disorders · prolactinoma

**CAUTIONS** Children · if there are cardiac concerns, obtain ECG before and during treatment

**INTERACTIONS** → Appendix 1: domperidone

**SIDE-EFFECTS**
- Common or very common Drowsiness · dry mouth · malaise
- Uncommon Anxiety · breast pain · decreased libido · diarrhoea · galactorrhoea · headache · pruritus · rash
- Frequency not known Agitation · amenorrhoea · convulsions · extrapyramidal disorders · gynaecomastia · nervousness · oculogyric crisis · QT-interval prolongation · sudden cardiac death · urinary retention · ventricular arrhythmias

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment.

**RENAL IMPAIRMENT** Reduce frequency.

**PATIENT AND CARER ADVICE**
Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Medicines for Children leaflet: Domperidone for gastro-oesophageal reflux www.medicinesforchildren.org.uk/domperidone-for-gastro-oesophageal-reflux

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**

**Tablet**

- [Domperidone (non-proprietary)](https://www.medicinesforchildren.org.uk/domperidone-for-gastro-oesophageal-reflux)

---

**Metoclopramide hydrochloride**

**INDICATIONS AND DOSE**
Second-line option for treatment of established postoperative nausea and vomiting · Prevention of delayed chemotherapy-induced nausea and vomiting

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - **Child**: 100–150 micrograms/kg up to 3 times a day (max. per dose 10 mg), when administered by slow intravenous injection, to be given over at least 3 minutes

**UNLICENSED USE** Maxolon® tablets not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)**

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose and duration of use have been made:

- In children aged 1–18 years, metoclopramide should only be used as a second-line option for prevention of delayed chemotherapy-induced nausea and vomiting and for treatment of established postoperative nausea and vomiting;
- Use of metoclopramide is contra-indicated in children aged under 1 year;
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Recommended dose is 100–150 micrograms/kg (max. 10 mg), repeated up to 3 times daily;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

**CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma

**CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · epilepsy · may mask underlying disorders such as cerebral irritation · uncorrected electrolyte imbalance

**INTERACTIONS** → Appendix 1: metoclopramide

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Extrapyramidal effects · galactorrhoea · gynaecomastia · hyperprolactinaemia · menstrual changes
- Very rare Depression · methaemoglobinemia (more severe in G6PD deficiency) · neuroleptic malignant syndrome

**드리마서**
Nausea and labyrinth disorders 253

- **Frequency not known** Anxiety · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · hypotension · oedema · pruritus · rash · restlessness · tardive dyskinesia on prolonged administration · tremor · urticaria · visual disturbances

**SPECIFIC SIDE-EFFECTS**

- **Very rare**
- With intravenous use Cardiac conduction abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

- Acute dystonic reactions Metoclopramide can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible. With metoclopramide, dystonic effects usually occur shortly after starting treatment and subside within 24 hours of stopping it. An antimuscarinic drug such as procyclidine is used to abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- **DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.
- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- **Metoclopramide hydrochloride (Non-proprietary)**
  - **Metoclopramide hydrochloride 5 mg per 1 ml** Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule POM £1.31 | 10 ampoule POM £3.30 DT price = £3.30

    - Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet POM £5.24

**ANTIEMETICS AND ANTINAUSEANTS > SEROTONIN (5HT3) RECEPTOR ANTAGONISTS**

Granisetron

**DRUG ACTION** Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

Management of nausea and vomiting induced by cytotoxic chemotherapy

- **BY MOUTH**
  - Child 12–17 years: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following chemotherapy

**INDICATIONS AND DOSE**

Prevention of postoperative nausea and vomiting

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds before, during, or after induction of anaesthesia

Treatment of postoperative nausea and vomiting

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—initial dose

- **BY INTRAVENOUS INFUSION**
  - Child 6 months–17 years (body surface area up to 1.3 m²): 5 mg/m² for 1 dose then give orally, alternatively 150 micrograms/kg
(max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally; maximum 32 mg per day

- Child 6 months-17 years (body surface area 1.3 m² and above): 8 mg for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally, intravenous infusion to be administered over at least 15 minutes; maximum 32 mg per day

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body surface area)

- By mouth
  - Child 6 months-17 years (body surface area up to 0.6 m²): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body surface area 0.6-1.2 m²): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body-weight)

- By mouth
  - Child 6 months-17 years (body-weight up to 10.1 kg): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body-weight 10.1-40 kg): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body-weight 41 kg and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

- **UNLICENSED USE** Not licensed for radiotherapy-induced nausea and vomiting in children.

- **CONTRA-INDICATIONS** Congenital long QT syndrome

- **CAUTIONS** Adenotonsillar surgery • subacute intestinal obstruction • susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1: ondansetron

- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**
  - Common or very common Constipation • flushing • headache • injection site-reactions
  - Uncommon Arrhythmias • bradycardia • chest pain • hiccups • hypotension • movement disorders • seizures

  **SPECIFIC SIDE-EFFECTS**
  - Rare
    - With intravenous use Dizziness • transient visual disturbances
  - Very rare
    - With intravenous use Transient blindness

- **PREGNANCY** No information available; avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk in animal studies—avoid.

- **HEPATIC IMPAIRMENT** Reduce dose in moderate or severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, dilute to a concentration of 320–640 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 15 minutes.
  - With oral use Ondansetron orodispersible films or lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  - Ondansetron (Non-proprietary)

  - Zofran Melt 8mg oral lyophilisates sugar-free | 10 tablet (PO) £71.94 DT price = £71.94

  **Ondansetron tablets**

  **Ondansetron (Non-proprietary)**
  - Ondansetron 4 mg Ondansetron 4mg orodispersible tablets | 10 tablet (PO) £43.46 DT price = £43.46
  - Ondansetron 8 mg Ondansetron 8mg orodispersible tablets | 10 tablet (PO) £85.43 DT price = £85.43
**ANTIＨIＳＴＡＭＩＮＥＳ**  >  **SEDATING**

**Cinnarizine**

- **INDICATIONS AND DOSE**
  - Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease
    - **BY MOUTH**
      - Child 5-11 years: 15 mg 3 times a day
      - Child 12-17 years: 30 mg 3 times a day
  - Motion sickness
    - **BY MOUTH**
      - Child 5-11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
      - Child 12-17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 577 (some antihistamines are thought to be safe) • neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy • glaucoma • pyloroduodenal obstruction • urinary retention
- **INTERACTIONS**  >  Appendix 1: antihistamines (sedating)
- **SIDE-EFFECTS**
  - Common or very common Drowsiness
  - Rare Anaphylaxis • angioedema • angle-closure glaucoma • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • lichen planus • liver dysfunction • lupus-like skin reactions • palpitaton • paradoxical stimulation (especially with high doses in children) • photosensitivity reactions • rashes • sleep disturbances • sweating • tremor • weight gain
  - Frequency not known Antimuscarinic effects • blurred vision • dry mouth • gastro-intestinal disturbances • headache • psychomotor impairment • urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Children are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - **2**
- **Cinnarizine**
  - **Non-proprietary**
  - Cinnarizine 15 mg Cinnarizine 15mg tablets  | 84 tablet  | £15.40
  - DT price  = £4.57
  - Stugeron (McNeil Products Ltd, Janssen-Cilag Ltd)
  - Cinnarizine 15 mg Stugeron 15mg tablets  | 15 tablet  | £1.84  | 100 tablet  | £4.18

**Promethazine teoclolate**

- **INDICATIONS AND DOSE**
  - **Nauser | Vomiting | Labyrinthine disorders**
    - **BY MOUTH**
      - Child 5-9 years: 12.5 – 37.5 mg daily
      - Child 10-17 years: 25 – 75 mg daily; maximum 100 mg per day
  - Motion sickness prevention (acts longer than promethazine hydrochloride)
    - **BY MOUTH**
      - Child 5-9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1 – 2 hours before travel
      - Child 10-17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1 – 2 hours before travel
  - Motion sickness treatment (acts longer than promethazine hydrochloride)
    - **BY MOUTH**
      - Child 5-9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
      - Child 10-17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN**

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity) • should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established
- **CAUTIONS** Acute porphyrias p. 577 • asthma • bronchiectasis • bronchitis • epilepsy • pyloroduodenal obstruction • Reye’s syndrome • severe coronary artery disease • susceptibility to angle-closure glaucoma • urinary retention
- **INTERACTIONS**  >  Appendix 1: antihistamines (sedating)
- **SIDE-EFFECTS**
  - Rare Anaphylaxis • angioedema • angle-closure glaucoma • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • palpitaton • photosensitivity reactions • rashes • sleep disturbances • tremor
  - Frequency not known Antimuscarinic effects • blurred vision • drowsiness • dry mouth • gastro-intestinal disturbances • headache • injection pain • psychomotor impairment • restlessness • urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Children are more susceptible to side-effects.
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**

### Antimuscarinics

**Hyoscine hydrobromide**

*(Scopolamine hydrobromide)*

- **INDICATIONS AND DOSE**
  - **Motion sickness**
    - **BY MOUTH**
      - Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
      - Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
  - **BY TRANSDERMAL APPLICATION**
    - Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
  - **Hypersalivation associated with clozapine therapy**
    - **BY MOUTH**
      - Child 12–17 years: 300 micrograms up to 3 times a day; maximum 900 micrograms per day
  - **Excessive respiratory secretions**
    - **BY MOUTH, OR BY SUBLINGUAL ADMINISTRATION**
      - Child 2–11 years: 10 micrograms/kg 4 times a day (max. per dose 300 micrograms)
    - **BY TRANSDERMAL APPLICATION**
      - Child 1 month–2 years: 250 micrograms every 72 hours, dose equates to a quarter patch
      - Child 3–9 years: 500 micrograms every 72 hours, dose equates to a half patch
      - Child 10–17 years: 1 mg every 72 hours, dose equates to one patch

- **UNLICENSED USE**
  - Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **CAUTIONS**
  - **Epilepsy**
  - **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
  - **BREAST FEEDING** Amount too small to be harmful.
  - **HEPATIC IMPAIRMENT** Use with caution.
  - **RENAL IMPAIRMENT** Use with caution.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of chewable tablet formulations may include raspberry.

**Palliative care**

For further information on the use of hyoscine hydrobromide in palliative care, see www.palliativedrugs.com/formulary/en/hyoscine-hydrobromide.html.

- **PATIENT AND CARER ADVICE**
  - With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

### BNFC 2017–2018
Driving and skilled tasks
- With transdermal use Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**ANTIPSYCHOTICS** > FIRST-GENERATION

**Droperidol**
- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

**INDICATIONS AND DOSE**
Prevention and treatment of postoperative nausea and vomiting
- **BY INTRAVENOUS INJECTION**
- Child 2-17 years: 20–50 micrograms/kg (max. per dose 1.25 mg), dose to be given 30 minutes before end of surgery, then 20–50 micrograms/kg every 6 hours (max. per dose 1.25 mg) if required

**CONTRA-INDICATIONS**
- Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-intraventricular prolongation
- **CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure
- **INTERACTIONS** > Appendix 1: phenothiazines
- **SIDE-EFFECTS** Anxiety · cardiac arrest · hallucinations · inappropriate antidiuretic hormone secretion
- **BREAST FEEDING** Limited information available—avoid repeated administration.
- **HEPATIC IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.
- **RENAL IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.
- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- **Droperidol (non-proprietary)**
  - Droperidol 2.5 mg per 1 ml Droperidol 2.5mg/1ml solution for injection ampoules | 10 ampoule [P] no price available
  - **Xomelix** (Kyowa Kirin Ltd)
    - Droperidol 2.5 mg per 1 ml Xomelix 2.5mg/1ml solution for injection ampoules | 10 ampoule [P] £39.40

**Levomepromazine**
(Methotrimeprazine)

**INDICATIONS AND DOSE**
Restlessness and confusion in palliative care
- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
  - Child 12-17 years: 12.5–200 mg, to be administered over 24 hours

**Nausea and vomiting in palliative care**
- **BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION**
  - Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
  - Child 12-17 years: 5–25 mg, to be administered over 24 hours

**CONTRA-INDICATIONS**
- CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Patients receiving large initial doses should remain supine
- **INTERACTIONS** > Appendix 1: phenothiazines
- **SIDE-EFFECTS** Raised erythrocyte sedimentation rate
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **DIRECTIONS FOR ADMINISTRATION** For administration by subcutaneous infusion dilute with a suitable volume of Sodium Chloride 0.9%.

**PREScribing and dispensing information**
- Palliative care For further information on the use of levomepromazine in palliative care, see www.palliativedrugs.com/formulary/en/levomepromazine.html.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- **Levomepromazine (non-proprietary)**
  - Levomepromazine hydrochloride 25 mg per 1 ml Levomepromazine 25mg/1ml solution for injection ampoules | 10 ampoule [P] £20.13 DT price = £20.13
  - **Nozinan** (Sanofi)
    - Levomepromazine hydrochloride 25 mg per 1 ml Nozinan 25mg/1ml solution for injection ampoules | 10 ampoule [P] £20.13 DT price = £20.13
Prochlorperazine

- **INDICATIONS AND DOSE**

  Prevention and treatment of nausea and vomiting
  - **BYmouth**
  - Child 1–11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
  - Child 12–17 years: 5–10 mg up to 3 times a day if required
  - **BY INTRAMUSCULAR INJECTION**
  - Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
  - Child 5–11 years: 5–6.25 mg up to 3 times a day if required
  - Child 12–17 years: 12.5 mg up to 3 times a day if required

  **Nausea and vomiting in previously diagnosed migraine**
  - **BYMOUTH USING BUCCAL TABLET**
  - Child 12–17 years: 3–6 mcg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

  **DOSE EQUIVALENT AND CONVERSION**
  - Doses are expressed as prochlorperazine maleate or prochlorperazine mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

- **CONTRA-INDICATIONS** Avoid oral route in child under 10 kg.
  - children (in psychotic disorders) • CNS depression • comatose states • phaeochromocytoma

- **CAUTIONS** Hypotension (more likely after intramuscular injection)

- **INTERACTIONS** → Appendix 1: phenothiazines

- **SIDE-EFFECTS** Dystonic reactions • respiratory depression may occur in susceptible patients

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **DIRECTIONS FOR ADMINISTRATION** Buccal tablets are placed high between upper lip and gum and left to dissolve.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**

  - Prochlorperazine maleate 3 mg Prochlorperazine 3mg buccal tablets | 50 tablet [PO] £35.94–£43.13 DT price = £43.13
  - Buccastem (Alliance Pharmaceuticals Ltd)
  - Prochlorperazine maleate 3 mg Buccastem M 3mg tablets | 8 tablet [PO] £3.66

  **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS**
  - Stemetil (Sanofi)
  - Prochlorperazine mesilate 1 mg per 1 ml Stemetil 5mg/5ml syrup | 100 ml [PO] £3.34 DT price = £3.34

5 Pain

**Analgesics**

**Drugs used for pain**

The non-opioid drugs, paracetamol p. 260 and ibuprofen p. 625 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

**Pain in sickle-cell disease**

The pain of mild sickle-cell crises is managed with paracetamol, an NSAID, codeine phosphate p. 265, or dihydrocodeine tartrate p. 268. Severe crises may require the use of morphine p. 271 or diamorphine hydrochloride p. 267; concomitant use of an NSAID may potentiate analgesia and allow lower doses of the opioid to be used. A mixture of nitrous oxide and oxygen (Entonox®, Equanox®) may also be used.

**Dental and orofacial pain**

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

- Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

  - Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride p. 677 or topical anaesthetics until the cause of the mucosal disorder has been dealt with. However, where a child is febrile, the antipyretic action of paracetamol or ibuprofen is often helpful.

  - The choice of an analgesic for dental purposes should be based on its suitability for the child. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs) e.g. ibuprofen. Paracetamol has analgesic and anti-inflammatory effects but no anti-inflammatory effect.

  - Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant.

  - Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of...
each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen is usually continued for about 24 to 72 hours.

**Dysmenorrhea**
Paracetamol or a NSAID will generally provide adequate relief of pain from dysmenorrhea. Alternatively use of a combined hormonal contraceptive in adolescent girls may prevent the pain.

**Non-opioid analgesics and compound analgesic preparations**
Paracetamol has analgesic and antipyretic properties but no demonstrable anti-inflammatory activity; unlike opioid analgesics, it does not cause respiratory depression and is less irritant to the stomach than the NSAIDs. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

**Non-steroidal anti-inflammatory analgesics** (NSAIDs) are particularly useful for the treatment of children with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred. They are also suitable for the relief of pain in dysmenorrhea and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Due to an association with Reye’s syndrome, aspirin p. 89 should be avoided in children under 16 years except in Kawasaki disease or for its antiplatelet action. Several NSAIDs are also used for postoperative analgesia.

**Compound analgesic preparations**
Compound analgesic preparations that contain a simple analgesic (such as paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

**Compound analgesic preparations containing paracetamol with a low dose of an opioid analgesic** (e.g. 8 mg of codeine phosphate per compound tablet) may be used in older children but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

**Opioid analgesics**
Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the child should be assessed at regular intervals.

**Strong opioids**
Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in *palliative care*. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 263 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in children dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 813. It is rarely used in children.

Diamorphine hydrochloride (heroin) p. 267 is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine p. 271. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated child. Diamorphine hydrochloride is sometimes given by the intranasal route to treat acute pain in children and is available as a nasal spray; *intrasanal* administration of diamorphine injection has been used [unlicensed].

Alfentanil p. 788, fentanyl p. 268 and remifentanil p. 789 are used by injection for intra-operative analgesia. Fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 286 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine when excitation (or exacerbation of pain) occurs with morphine. Methadone hydrochloride may also be used to treat children with neonatal abstinence syndrome.

Papaveretum p. 275 should not be used in children; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pethidine hydrochloride p. 276 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. Its use in children is not recommended. Pethidine hydrochloride is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tramadol hydrochloride p. 276 is used in older children and produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

**Weak opioids**
Codeine phosphate p. 265 can be used for the relief of short-term acute moderate pain in children older than 12 years where other painkillers such as paracetamol p. 260 or ibuprofen p. 625 have proved ineffective.

Dihydrocodeine tartrate p. 268 has an analgesic efficacy similar to that of codeine phosphate.

**Postoperative analgesia**
A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.
Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 263 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in neonates and in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) and nurse-controlled analgesia (NCA) can be used to relieve postoperative pain—consult hospital protocols.

Pain management and opioid dependence
Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**Analgesics > Non-opioid**

### Paracetamol

Prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine
BY MOUTH
Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours
Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours

Post-immunisation pyrexia in infants
BY MOUTH
Child 2-3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required
Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

PANADOL OA®
Mild to moderate pain | Pyrexia
BY MOUTH
Child 12-17 years: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

UNLICENSED USE
Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use in children under 2 months by mouth; under 3 months by rectum. [EvG] Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. [Ev] Intravenous infusion not licensed in pre-term neonates. Intravenous infusion dose not licensed in children and neonates with body-weight under 10 kg.

CAUTIONS
Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · body-weight under 50 kg · chronic alcohol consumption · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · long-term use (especially in those who are malnourished)

CAUTIONS, FURTHER INFORMATION
[EvG] Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients. [Ev]
[EvG] Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced. [Ev]

INTERACTIONS → Appendix 1: paracetamol

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Rare · Acute generalised exanematous pustulosis · malaise · skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis
Frequency not known · Blood disorders · leucopenia · neutropenia · thrombocytopenia

SPECIFIC SIDE-EFFECTS
Rare
With intravenous use · Flushing · tachycardia

Frequency not known
With intravenous use · Hypotension

Overdose
Important: liver damage and less frequently renal damage can occur following overdose.
Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.
For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 803

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Amount too small to be harmful.

HEPATIC IMPAIRMENT
Dose-related toxicity—avoid large doses.

RENAL IMPAIRMENT
Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL/vial.

PRESCRIBING AND DISPENSING INFORMATION
BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildt moderately-pain

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Paracetamol Tablets may be prescribed.
Paracetamol Soluble Tablets 500 mg may be prescribed.
Paracetamol Oral Suspension may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY
Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

**Combinations available:** Co-codamol, p. 264 - Co-dydramol, p. 266

---

**Paracetamol with tramadol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 260, tramadol hydrochloride p. 276.

- **INDICATIONS AND DOSE**
  - Moderate to severe pain
    - **BY MOUTH**
      - Child 12-17 years: 2 tablets up to every 6 hours; maximum 8 tablets per day

- **INTERACTIONS** → Appendix 1: opioids, paracetamol

- **MIDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Effervescent tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Perfalgan** 37.5mg/5ml effervescent tablets sugar-free | 60 tablet (P) £9.68 DT price = £9.68 CD3

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Paracetamol with tramadol** (Non-proprietary)
  - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramacet 37.5mg/325mg effervescent tablets sugar-free | 60 tablet (P) £9.68 DT price = £9.22 CD3

**ANALGESICS > OPIOIDS**

**Opioids**

- **CONTRA-INDICATIONS**
  - Acute respiratory depression - comatose patients - head injury (opioid analgesics interfere with pupillary responses vital for neurologcal assessment)
  - raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurologcal assessment)
  - risk of paralytic ileus

- **CAUTIONS**
  - Adrenocortical insufficiency (reduced dose is recommended) - asthma (avoid during an acute attack) - convulsive disorders - diseases of the biliary tract - hypotension - hypothyroidism (reduced dose is recommended) - impaired respiratory function (avoid in chronic obstructive pulmonary disease) - inflammatory bowel disorders - myasthenia gravis - obstructive bowel disorders - shock

  **CAUTIONS, FURTHER INFORMATION**

  - Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
  - Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

- **SIDE-EFFECTS**
  - Common or very common Biliary spasm - bradycardia - confusion - constipation - dependence - difficulty with micturition - dizziness - drowsiness - dry mouth - dysphoria - euphoria - flushing - hallucinations - headache - hypotension (larger doses) - miosis - mood changes - muscle rigidity (larger doses) - nausea (particularly in initial stages) - oedema - palpitation - postural hypotension - pruritus - rash - respiratory depression (larger doses) - sexual dysfunction - sleep disturbances - sweating...
tachycardia · uretic spasm · urinary retention · uralcic · vertigo · visual disturbances · vomiting (particularly in initial stages)

- Frequency not known Adrenal insufficiency (long-term use) · hypergesia (long-term use) · hypogonadism (long-term use)

SIDE-EFFECTS, FURTHER INFORMATION

- Hypogonadism and adrenal insufficiency Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.

- Hypergesia Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hypergesia). Pain associated with hypergesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hypergesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hypergesia should be referred to a specialist pain team.

- Respiratory depression Respiratory depression is a major concern with opioid analgesics; neonates (particularly if pre-term) may be more susceptible. It may be treated by artificial ventilation or be reversed by naloxone.

- Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

OVERDOSE

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 803 and consider the specific antidote, naloxone hydrochloride p. 813.

- PREGNANCY Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

- HEPATIC IMPAIRMENT Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.

- TREATMENT CESSATION Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

- PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and Skilled Tasks under Guidance on prescribing p. 1.

Buprenorphine

- DRUG ACTION Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

- INDICATIONS AND DOSE

  - Moderate to severe pain
    - BY ORAL ADMINISTRATION
      - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
      - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
      - Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
    - ORAL: 200 micrograms 1 tablet
      - 3 tablets P Dam £0.47
      - 2 tablets P Dam £0.37
    - ORAL: 300 micrograms 1 tablet
      - 1 tablet P Dam £0.57
      - 2 tablets P Dam £1.08
    - ORAL: 600 micrograms 1 tablet
      - 1 tablet P Dam £1.16
      - 2 tablets P Dam £2.32
    - ORAL: 800 micrograms 1 tablet
      - 1 tablet P Dam £1.59
      - 2 tablets P Dam £3.17
    - ORAL: 1200 micrograms 1 tablet
      - 1 tablet P Dam £2.38
      - 2 tablets P Dam £4.76
    - ORAL: 1600 micrograms 1 tablet
      - 1 tablet P Dam £3.15
      - 2 tablets P Dam £6.30

- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

  - Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
  - BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

  - Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
  - Child 12–17 years: 300–600 micrograms every 6–8 hours

- UNLICENSED USE

  - Sublingual tablets not licensed for use in children under 6 years.

- CAUTIONS

  - Impaired consciousness

- INTERACTIONS

  - Appendix 1: opioids

- SIDE-EFFECTS

  - Common or very common Abdominal pain · agitation · anorexia · anxiety · asthenia · diarrhoea · dyspepsia · dyspnoea · fatigue · mild withdrawal symptoms in patients dependent on opioids · paraesthesia · vasodilatation

  - Uncommon Cough · depersonalisation · dry eye · dry skin · dysarthria · flatulence · hypertension · hypoaesthesia · hypoxia · impaired memory · influenza-like symptoms · muscle cramp · myalgia · pyrexia · restlessness · rhinitis · rigors · syncope · taste disturbance · tinnitus · tremor · wheezing

  - Rare Diverticulitis · dysphagia · impaired concentration · paralytic ileus · psychosis

  - Very rare Hiccups · hyperventilation · muscle fasciculation · retching

  - Frequency not known Hepatic necrosis · hepatitis

OVERDOSE

The effects of buprenorphine are only partially reversed by naloxone.

- BREAST FEEDING

  - Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

- RENAL IMPAIRMENT

  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- PRE-TREATMENT SCREENING

  - Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

- MONITORING REQUIREMENTS

  - Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

- DIRECTIONS FOR ADMINISTRATION

  - For administration by mouth, tablets may be halved.

- MEDICINAL FORMS

  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

  - Temgesic (RB Pharmaceuticals Ltd)
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 300 microgram per 1 ml Temgesic 300micrograms/1ml solution for injection ampoules | 5 ampoule P Dam £2.46 (D3)

Sublingual tablet

  - CAUTIONARY AND ADVISORY LABELS 2, 26
    - Buprenorphine (Non-proprietary)
      - Buprenorphine (as Buprenorphine hydrochloride)
        - 200 microgram Buprenorphine 200microgram sublingual tablets sugar free sugar-free | 50 tablet P Dam £6.05 OT price = £5.04 (D3)
      - Buprenorphine (as Buprenorphine hydrochloride)
        - 400 microgram Buprenorphine 400microgram sublingual tablets sugar free sugar-free | 7 tablet P Dam £1.60 OT price = £1.60 (D3)
      - Buprenorphine (as Buprenorphine hydrochloride)
        - 2 mg Buprenorphine 2mg sublingual tablets sugar free sugar-free | 7 tablet P Dam £8.35 OT price = £1.33 (D3)
      - Buprenorphine (as Buprenorphine hydrochloride)
        - 8 mg Buprenorphine 8mg sublingual tablets sugar free sugar-free | 7 tablet P Dam £22.50 OT price = £2.21 (D3)

27-Apr-2017
Co-codamol

**INDICATIONS AND DOSE**

**Short-term treatment of acute moderate pain (using co-codamol 8/500 preparations only)**

- **BY MOUTH**
  - Child 12-17 years: 8/500–16/1000 mg every 6 hours as required for maximum 3 days; maximum 64/4000 mg per day
  - Short-term treatment of acute moderate pain (using co-codamol 15/5000 preparations only)
  - **BY MOUTH**
  - Child 12-17 years: 15/500–30/1000 mg every 6 hours as required for maximum 3 days; maximum 120/4000 mg per day
  - Short-term treatment of acute moderate pain (using co-codamol 30/5000 preparations only)
  - **BY MOUTH**
  - Child 12-17 years: 30/500–60/1000 mg every 6 hours as required for maximum 3 days; maximum 240/4000 mg per day

**KAPAKE® 15/500**

**Short-term treatment of acute pain**

- **BY MOUTH**
  - Child 12-15 years: 1 tablet every 6 hours as required for maximum 3 days; maximum 4 tablets per day

**CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

**CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepato-cellular insufficiency

**CAUTIONS, FURTHER INFORMATION**

- Variation in metabolism: The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

**INTERACTIONS**

1. opioids, paracetamol

**SIDE-EFFECTS**

- Abdominal pain
- anorexia · blood disorders
- depression (with larger doses) · hypothermia · leucopenia
- malaise · muscle fasciculation · neutropenia · pancreatitis
- seizures · thrombocytopenia

**Overdose**

**Important**: liver damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING** Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.

**RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form $x/y$, where $x$ and $y$ are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and vice versa.

**LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**INDICATIONS AND DOSE**

**Acute diarrhoea**

- **BY MOUTH**
  - Child 12-17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

**Short-term treatment of acute moderate pain**

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION**
  - Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- In children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- Codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- Codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- Codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-metabolisers)
- Codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- Parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, ‘pin-point’ pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine
is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:
- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

**CONTRA-INDICATIONS** Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

**CAUTIONS** Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

**CAUTIONS, FURTHER INFORMATION**
- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **INTERACTIONS** → Appendix 1: opioids
  - Abdominal pain - anorexia - antidiuretic effect - hypothermia - malaise - muscle fasciculation - pancreatitis - seizures

**BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

**Co-dydramol**

- **INDICATIONS AND DOSE**
  - Mild to moderate pain (using co-dydramol 10/500 preparations only)
    - **BY MOUTH**
      - Child 12–17 years: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day
  - Severe pain (using co-dydramol 20/500 preparations only)
    - **BY MOUTH**
      - Child 12–17 years: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day
  - Severe pain (using co-dydramol 30/500 preparations only)
    - **BY MOUTH**
      - Child 12–17 years: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

- **DOSE EQUIVALENCE AND CONVERSION**

  A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

- **CAUTIONS** Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency - pancreatitis - severe cor pulmonale

- **INTERACTIONS** → Appendix 1: opioids, paracetamol

- **SIDE-EFFECTS** Abdominal pain - acute generalised exanthematous pustulosis - blood disorders - leucopenia - malaise - neutropenia - pancreatitis - parasthesia - paralytic ileus - skin reactions - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis

- **OVERDOSE**

  Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING** Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.

- **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.

- **PRESCRIBING AND DISPENSING INFORMATION** When co-dydramol tablets are prescribed and no strength is stated, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.

- **LESS SUITABLE FOR PRESCRIBING** Co-dydramol is less suitable for prescribing.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

**Tablet**

**DIRECTIONS FOR ADMINISTRATION**

- With intranasal use Manufacturer advises monitor for at least 30 minutes following administration.

- With intranasal use For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; Glucose 5% is preferable as an infusion fluid.

- With intranasal use Manufacturer advises spray should be directed at the nasal side wall whilst the patient is in a semi-recumbent position.

**PRESCRIBING AND DISPENSING INFORMATION** Intranasal administration of diamorphine hydrochloride injection has been used [unlicensed]—no dose recommendation.

**INDICATIONS AND DOSE**

**Acute or chronic pain**

- **BY MOUTH**
  - Child 1 month–11 years: 100–200 micrograms/kg every 4 hours (max. dose 10 mg), adjusted according to response
  - Child 12–17 years: 5–10 mg every 4 hours, adjusted according to response
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 12.5–25 micrograms/kg/hour, adjusted according to response
  - **BY INTRAVENOUS INJECTION**
  - Child 1–2 months: 20 micrograms/kg every 6 hours, adjusted according to response
  - Child 3–5 months: 25–50 micrograms/kg every 6 hours, adjusted according to response
  - Child 6–11 months: 75 micrograms/kg every 4 hours, adjusted according to response
  - Child 11 years: 75–100 micrograms/kg every 4 hours (max. dose 5 mg), adjusted according to response
  - Child 12–17 years: 2.5–5 mg every 4 hours, adjusted according to response
  - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 12–17 years: 5 mg every 4 hours, adjusted according to response

**Acute or chronic pain in ventilated neonates**

**INITIALLY BY INTRAVENOUS INFUSION**

- Neonate: Initially 50 micrograms/kg, dose to be administered over 30 minutes, followed by (by continuous intravenous infusion) 15 micrograms/kg/hour, adjusted according to response.

**Acute or chronic pain in non-ventilated neonates**

**BY CONTINUOUS INTRAVENOUS INFUSION**

- Neonate: 2.5–7 micrograms/kg/hour, adjusted according to response.

**Acute severe nociceptive pain in an emergency setting (specialist supervision in hospital)**

- **BY INTRAVENOUS ADMINISTRATION**
  - Child 2–15 years (body-weight 12–17 kg): 1.44 mg for 1 dose, spray into alternate nostrils
  - Child 2–15 years (body-weight 18–23 kg): 2.16 mg for 1 dose, spray into alternate nostrils
  - Child 2–15 years (body-weight 24–29 kg): 2.88 mg for 1 dose, spray into alternate nostrils
  - Child 2–15 years (body-weight 30–39 kg): 3.2 mg for 1 dose, spray into alternate nostrils
  - Child 2–15 years (body-weight 40–50 kg): 4.8 mg for 1 dose, spray into alternate nostrils

**CONTRA-INDICATIONS** Delayed gastric emptying • phaeochromocytoma
**INDICATIONS AND DOSE**

**Moderate to severe pain**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1-3 years: 500 micrograms/kg every 4–6 hours
  - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12-17 years: 30 mg every 4–6 hours
- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 1-3 years: 500 micrograms/kg every 4–6 hours
  - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12-17 years: 30 mg every 4–6 hours (max. per dose 50 mg)

**Chronic severe pain**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 60–120 mg every 12 hours

**DF118 FORTE®**

**Severe pain**
- **BY MOUTH**
  - Child 12-17 years: 40–80 mg 3 times a day; maximum 240 mg per day

**UNLICENSED USE**
Most preparations not licensed for use in children under 4 years.

**CAUTIONS**
- Pancreatitis · severe cor pulmonale

**INTERACTIONS**
- → Appendix 1: opioids

**SIDE-EFFECTS**
Abdominal pain · diarrhoea · paraesthesia · paralytic ileus · seizures

**BREAST FEEDING**
Use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Dihydrocodeine tablets 30 mg may be prescribed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

- 150 ml (PO) £7.92 DT price = £7.92 (OD)

**Fentanyl**

**INDICATIONS AND DOSE**

**Chronic intractable pain not currently treated with a strong opioid analgesic**

**BY TRANSDERMAL APPLICATION**

**Child 16-17 years:** Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

**Chronic intractable pain currently treated with a strong opioid analgesic**

**BY TRANSDERMAL APPLICATION**

**Child 2-17 years:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under **Chronic intractable pain not currently treated with a strong opioid analgesic**, for conversion from long term oral morphine to transdermal fentanyl, see **Pain management with opioids** under p. 19.

**Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation**

**BY INTRAVENOUS INJECTION**

**Child 1 month–11 years:** Initially 1–3 micrograms/kg, then 1 microgram/kg as required, dose to be administered over at least 30 seconds

**Child 12-17 years:** Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required, dose to be administered over at least 30 seconds

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

**BY INTRAVENOUS INJECTION**

**Neonate:** Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds.

**Child 1 month–11 years:** Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds

**Child 12-17 years:** Initially 1–5 micrograms/kg, then 50–200 micrograms as required, dose to be administered over at least 30 seconds

**Assisted ventilation: analgesia and respiratory depression in intensive care**

**INITIALLY BY INTRAVENOUS INJECTION**

**Neonate:** Initially 1–5 micrograms/kg, then (by intravenous infusion) 1.5 micrograms/kg/hour, adjusted according to response.
INN: Fentanyl

Child: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1–6 micrograms/kg/hour, adjusted according to response

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- BY BUCAL ADMINISTRATION USING LOZENGES
- Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

DOSE EQUIVALENCE AND CONVERSION
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

**UNLICENSED USE**
- With intravenous use Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.

**CAUTIONS**
- Cerebral tumour - diabetes mellitus (with Actiq® lozenges) - impaired consciousness

**CAUTIONS, FURTHER INFORMATION**
- With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
- With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**INTERACTIONS**
- Appendix 1: opioids

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Abdominal pain - aesthonia - anorexia - anxiety - appetite changes - application-site reactions - diarrhoea - dyspepsia - dysphoria - gatro-esophageal reflux disease - hypertension - myoclonus - parasthesia - pharyngitis - rhinitis - stomatitis - tremor - vasodilation
- Rare Hiccups
- Very rare Apnoea - arrhythmia - ataxia - bladder pain - delusions - haemoptysis

**SPECIFIC SIDE-EFFECTS**
- Common or very common With intravenous use Myoclonic movements
- Uncommon With intravenous use Laryngospasm
- Rare With intravenous use Asystole - insomnia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).
- Muscle rigidity Intravenous administration of fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.
- **BREAST FEEDING** Monitor infant for opioid-induced side-effects.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
  - With intravenous use For intravenous infusion, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%.
  - With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

**PRESCRIBING AND DISPENSING INFORMATION**
- With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

**PATIENT AND CARER ADVICE**
- With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

Hydromorphone hydrochloride

**INDICATIONS AND DOSE**

**Severe pain in cancer**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12–17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

**CONTRA-INDICATIONS**
- Acute abdomen

**CAUTIONS**
- Pancreatitis · toxic psychosis

**INTERACTIONS**
- Appendix 1: opioids

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anorexia · anxiety
- **Uncommon** Agitation · diarrhoea · dysgeusia · dyskinesia · myoclonus · paraesthesia · paralytic ileus · peripheral oedema · seizures · tremor

**BREAST FEEDING**
- Avoid—no information available.

**RENAL IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
- For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS 2**
- **Palladone SR** (Napp Pharmaceuticals Ltd)
  - Hydromorphone hydrochloride 2 mg: Palladone SR 2mg capsules
  - 56 capsule [PO] £20.98 [D2]
  - Hydromorphone hydrochloride 4 mg: Palladone SR 4mg capsules
  - 56 capsule [PO] £28.75 [D2]
  - Hydromorphone hydrochloride 8 mg: Palladone SR 8mg capsules
  - 56 capsule [PO] £56.08 [D2]
  - Hydromorphone hydrochloride 16 mg: Palladone SR 16mg capsules
  - 56 capsule [PO] £106.53 [D2]
  - Hydromorphone hydrochloride 24 mg: Palladone SR 24mg capsules
  - 56 capsule [PO] £159.82 [D2]

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 2**
- **Palladone** (Napp Pharmaceuticals Ltd)
  - Hydromorphone hydrochloride 1.3 mg: Palladone 1.3mg capsules
  - 56 capsule [PO] £8.82 [D2]
  - Hydromorphone hydrochloride 2.6 mg: Palladone 2.6mg capsules
  - 56 capsule [PO] £17.64 [D2]
### Pain (with modified-release 12-hourly preparations)

- **By mouth using modified-release medicines**
  - Child: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

- **Pain (with modified-release 24-hourly preparations)**
  - **By mouth using modified-release medicines**
    - Child: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

- **Neonatal opioid withdrawal (under expert supervision)**
  - **By mouth**
    - Neonate: Initially 40 micrograms/kg every 4 hours until symptoms controlled, dose to be increased if necessary; reduce frequency gradually over 6–10 days, stop when 40 micrograms/kg once daily achieved, dose may vary—consult local guidelines.

### Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)

- **By intravenous injection, or by intramuscular injection**
  - Child: 100 micrograms/kg

### Dose equivalence and conversion

- The doses stated refer equally to morphine hydrochloride and sulfate.

### Unlicensed use

- With rectal use: Suppositories are not licensed for use in children.

### Important safety information

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

### Contra-indications

- Acute abdomen: delayed gastric emptying; heart failure secondary to chronic lung disease; phaeochromocytoma

### Cautionary and advisory labels

- Cautionary and advisory labels

### Side-effects

- Abdominal pain; agitation; amenorrhoea; anorexia; asthenia; bronchospasm; delirium; disorientation; dyspepsia; exacerbation of pancreatitis; excitation; hypertension; hypothermia; inhibition of cough reflex; malaise; muscle fasciculation; myoclonus; nystagmus; paraesthesia; paralytic ileus; raised intracranial pressure; restlessness; rhadomyolysis; seizures; syncope; taste disturbance

### Breast feeding

Therapeutic doses unlikely to affect infant.

### Renal impairment

Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

### Directions for administration

- With intravenous use: For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With intravenous use in neonates: *Neonatal intensive care*, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.

### With oral use

For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.

### Prescribing and dispensing information

- Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include *Filinarine®* SR, *MST Continus®*, *Morphgesic SR* and *Zomorph®*. Preparations that should be given 24-hourly include *MXL®*

- Prescriptions must specify the ‘form’.

### Patient and carer advice

Patients or carers should be given advice on how to administer morphine modified-release capsules.

Medicines for Children leaflet: Morphine for pain [www.medicinesforchildren.org.uk/morphine-for-pain](http://www.medicinesforchildren.org.uk/morphine-for-pain)

### Exceptions to legal category

Morphine Oral Solutions: Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS 2, 25**

- **MST Continus (Napp Pharmaceuticals Ltd)**
  - Morphine sulfate 5 mg MST Continus 5mg tablets | 60 tablet £3.29 DT price = £3.29
  - Morphine sulfate 10 mg MST Continus 10mg tablets | 60 tablet £5.20 DT price = £5.20
  - Morphine sulfate 15 mg MST Continus 15mg tablets | 60 tablet £9.10 DT price = £9.10
  - Morphine sulfate 30 mg MST Continus 30mg tablets | 60 tablet £12.47 DT price = £12.47
  - Morphine sulfate 60 mg MST Continus 60mg tablets | 60 tablet £24.32 DT price = £24.32
  - Morphine sulfate 100 mg MST Continus 100mg tablets | 60 tablet £38.50 DT price = £38.50
  - Morphine sulfate 200 mg MST Continus 200mg tablets | 60 tablet £81.34 DT price = £81.34

- **Morphgesic SR (AMCo)**
  - Morphine sulfate 10 mg Morphgesic SR 10mg tablets | 60 tablet £3.85 DT price = £3.85
  - Morphine sulfate 30 mg Morphgesic SR 30mg tablets | 60 tablet £9.24 DT price = £9.24
  - Morphine sulfate 60 mg Morphgesic SR 60mg tablets | 60 tablet £18.04 DT price = £18.04
  - Morphine sulfate 100 mg Morphgesic SR 100mg tablets | 60 tablet £28.54 DT price = £28.54

### Tablet

- **CAUTIONARY AND ADVISORY LABELS 2**

- **Sevredol (Napp Pharmaceuticals Ltd)**
  - Morphine sulfate 10 mg Sevredol 10mg tablets | 56 tablet £5.31 DT price = £5.31
  - Morphine sulfate 20 mg Sevredol 20mg tablets | 56 tablet £10.61 DT price = £10.61
  - Morphine sulfate 50 mg Sevredol 50mg tablets | 56 tablet £28.02 DT price = £28.02

### Suppository

- **CAUTIONARY AND ADVISORY LABELS 2**

- **Morphine (Non-proprietary)**
  - Morphine sulfate 10 mg Morphine sulfate 10mg suppositories | 12 suppository £18.62 DT price = £18.62
Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 271, cyclizine p. 250.

**INDICATIONS AND DOSE**

**CYCLIMORPH-10®**

Moderate to severe pain (short-term use only)

- By subcutaneous injection, or by intramuscular injection, or by intravenous injection
- Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

**CYCLIMORPH-15®**

Moderate to severe pain (short-term use only)

- By subcutaneous injection, or by intramuscular injection, or by intravenous injection
- Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

**CAUTIONS**

Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) • not recommended in palliative care

**INTERACTIONS**

Appendix 1: antihistamines (sedating), opioids

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Cyclimorph (AMCo)**
  - Morphine tartrate 15 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
  - Cyclimorph 15 solution for injection 1 mL ampoules
  - 5 ampoules (Pom) £9.12 (CD)
  - Morphine tartrate 10 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
  - Cyclimorph 10 solution for injection 1 mL ampoules
  - 5 ampoules (Pom) £8.77 (CD)

**Morphine sulfate 100 mg**

- MST Continus Suspension 100 mg granules sachets sugar-free • 30 sachet (Pom) £85.15 (CD)

**Morphine sulfate 200 mg**

- MST Continus Suspension 200 mg granules sachets sugar-free • 30 sachet (Pom) £170.30 (CD)

**Oxycodone hydrochloride**

**INDICATIONS AND DOSE**

Moderate to severe pain in palliative care

- By mouth using immediate-release medicines
- Child 1 month-11 years: Initially 200 micrograms/kg every 4–6 hours (max. per dose 5 mg), dose to be increased if necessary according to severity of pain
- Child 12-17 years: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain
- By mouth using modified-release medicines
- Child 8-11 years: Initially 5 mg every 12 hours, dose to be increased if necessary according to severity of pain
- Child 12-17 years: Initially 10 mg every 12 hours, dose to be increased if necessary according to severity of pain

**DOSE EQUIVALENCE AND CONVERSION**

- 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

**ONEXILA XL®**

**Severe pain**

- By mouth
- Child 12-17 years: Initially 10 mg every 24 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

**UNLICENSED USE**

Oral solution, Oxynorm®, Longtec®, and Oxycontin® not licensed for use in children. Capsules and
**Dolcod® PR not licensed for use in children under 12 years.**

**IMPORTANT SAFETY INFORMATION**
Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

- **CONTRA-INDICATIONS** Acute abdomen - chronic constipation - cor pulmonale - delayed gastric emptying

- **CAUTIONS** Pancreatitis - toxic psychosis

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - anorexia - anxiety - asthenia - bronchospasm - chills - diarrhoea - dyspepsia - dyspnoea - impaired cough reflex

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.

- **RENAI IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment. Opioid effects increased and prolonged and increased cerebral sensitivity occurs.

  Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include Abtard®, Carexi®, Leveraxo®, Longtec®, Oxeltra®, Oxcon®®, Oxylan®®, Reltebon®, and Zomestine®. Preparations that should be given 24-hourly include Onexila® XL.

Palliative care
For further information on the use of oxycodone in palliative care, see www.palliativedrugs.com/formulary/en/oxycodone.html.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 2, 25**

- **Oxycodone hydrochloride (Non-proprietary)**
  - Oxycodone hydrochloride 5 mg Oxycodone 5mg modified-release tablets | 28 tablet (POT) £12.52 DT price = £12.52 (C2)
  - Oxycodone hydrochloride 10 mg Oxycodone 10mg modified-release tablets | 56 tablet (POT) £25.04 DT price = £25.04 (C2)
  - Oxycodone hydrochloride 20 mg Oxycodone 20mg modified-release tablets | 56 tablet (POT) £50.08 DT price = £50.08 (C2)

  - Oxycodone hydrochloride 80 mg Oxeltra 80mg modified-release tablets | 56 tablet (POT) £180.35 DT price = £180.35 (C2)

- **OxContin** (Napp Pharmaceuticals Ltd)
  - Oxycodone hydrochloride 5 mg OxContin 5mg modified-release tablets | 28 tablet (POT) £12.52 DT price = £12.52 (C2)
Papaveretum

INDICATIONS AND DOSE
Postoperative anaesthesia | Severe chronic pain

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Neonate: 115 micrograms/kg every 4 hours if required.

Child 1-11 months: 154 micrograms/kg every 4 hours if required

Child 1-5 years: 1.93-3.85 mg every 4 hours if required

Child 6-11 years: 3.85-7.7 mg every 4 hours if required

Child 12-17 years: 7.7-15.4 mg every 4 hours if required

BY INTRAVENOUS INJECTION

Child: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

Premedication

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Neonate: 115 micrograms/kg every 4 hours if required.

Child 1-11 months: 154 micrograms/kg every 4 hours if required

Child 1-5 years: 1.93-3.85 mg every 4 hours if required

Child 6-11 years: 3.85-7.7 mg every 4 hours if required

Child 12-17 years: 7.7-15.4 mg every 4 hours if required

BY INTRAVENOUS INJECTION

Child: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

IMPORTANT SAFETY INFORMATION
Do not confuse with papaverine.

CONTRA-INDICATIONS
Heart failure secondary to chronic lung disease • phaeochromocytoma

CAUTIONS
Supraventricular tachycardia

INTERACTIONS • Appendix 1: opioids

SIDE-EFFECTS
Hyperthermia

BREAST FEEDING
Therapeutic doses unlikely to affect infant.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

PRESCRIBING AND DISPENSING INFORMATION
The name Omnopon® was formerly used for papaveretum preparations.
Papaveretum is less suitable for prescribing.

LESS SUITABLE FOR PRESCRIBING Papaveretum is less suitable for prescribing.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Papaveretum (Non-proprietary)

Papaveretum 15.4 mg per 1 ml Papaveretum 15.4mg/1ml solution for injection ampoules | 10 ampoule (Pom) £48.96 (CD)

Pethidine hydrochloride
(Meperidine)

INDICATIONS AND DOSE Obstetric analgesia

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Child 12–17 years: 1 mg/kg (max. per dose 100 mg), then 1 mg/kg after 1–3 hours if required; maximum 400 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Accumulation of metabolites may result in neurotoxicity • cardiac arrhythmias • not suitable for severe continuing pain • severe cor pulmonale

INTERACTIONS Appendix 1: opioids

SIDE-EFFECTS Hypothermia • restlessness • tremor

Overdose

Convulsions reported in overdosage.

BREAST FEEDING Present in milk but not known to be harmful.

RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Pethidine hydrochloride (Non-proprietary)

Pethidine hydrochloride 10 mg per 1 ml Pethidine 50mg/5ml solution for injection ampoules | 10 ampoule (Pom) £52.91 (CD)

Pethidine hydrochloride 50 mg per 1 ml Pethidine 50mg/1ml solution for injection ampoules | 10 ampoule (Pom) £4.97 DT price = £4.97 (CD)

Pethidine 100mg/2ml solution for injection ampoules | 10 ampoule (Pom) £4.66 DT price = £4.66 (CD)

Tramadol hydrochloride

INDICATIONS AND DOSE

Moderate to severe pain

BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child 12–17 years: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

Moderate to severe acute pain

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

INTERACTIONS Appendix 1: opioids

SIDE-EFFECTS

COMMON or very common Malaise

UNCOMMON Diarrhoea • flatulence • gastritis • retching

RARE Abnormal coordination • anorexia • anxiety • bronchospasm • changes in appetite • delirium • dyspnoea • hypertension • muscle weakness • nightmares • paraesthesia • seizures • syncope • tremor • wheezing

Frequency not known Blood disorders • hypoglycaemia • speech disorders

PREGNANCY Embryotoxic in animal studies—manufacturers advise avoid.

BREAST FEEDING Amount probably too small to be harmful, but manufacturer advises avoid.

HEPATIC IMPAIRMENT Caution (avoid for oral drops) in severe impairment.

RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

CONTRA-INDICATIONS Acute intoxication with alcohol • acute intoxication with analgesics • acute intoxication with hypnotics • acute intoxication with opioids • not suitable for narcotic withdrawal treatment • uncontrolled epilepsy

CAUTIONS Excessive bronchial secretions • history of epilepsy—use tramadol only if compelling reasons • impaired consciousness • not suitable as a substitute in opioid-dependent patients • not suitable in some types of general anaesthesia • susceptibility to seizures—use tramadol only if compelling reasons

CAUTIONS, FURTHER INFORMATION

General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

INTERACTIONS Appendix 1: opioids

SIDE-EFFECTS

COMMON or very common Malaise

UNCOMMON Diarrhoea • flatulence • gastritis • retching

RARE Abnormal coordination • anorexia • anxiety • bronchospasm • changes in appetite • delirium • dyspnoea • hypertension • muscle weakness • nightmares • paraesthesia • seizures • syncope • tremor • wheezing

Papaveretum is less suitable for prescribing.

LESS SUITABLE FOR PRESCRIBING Papaveretum is less suitable for prescribing.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Papaveretum (Non-proprietary)

Papaveretum 15.4 mg per 1 ml Papaveretum 15.4mg/1ml solution for injection ampoules | 10 ampoule (Pom) £48.96 (CD)

Pethidine hydrochloride
(Meperidine)

INDICATIONS AND DOSE Obstetric analgesia

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Child 12–17 years: 1 mg/kg (max. per dose 100 mg), then 1 mg/kg after 1–3 hours if required; maximum 400 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Accumulation of metabolites may result in neurotoxicity • cardiac arrhythmias • not suitable for severe continuing pain • severe cor pulmonale

INTERACTIONS Appendix 1: opioids

SIDE-EFFECTS Hypothermia • restlessness • tremor

Overdose

Convulsions reported in overdosage.

BREAST FEEDING Present in milk but not known to be harmful.

RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Pethidine hydrochloride (Non-proprietary)

Pethidine hydrochloride 10 mg per 1 ml Pethidine 50mg/5ml solution for injection ampoules | 10 ampoule (Pom) £52.91 (CD)

Pethidine hydrochloride 50 mg per 1 ml Pethidine 50mg/1ml solution for injection ampoules | 10 ampoule (Pom) £4.97 DT price = £4.97 (CD)

Pethidine 100mg/2ml solution for injection ampoules | 10 ampoule (Pom) £4.66 DT price = £4.66 (CD)

Tramadol hydrochloride

INDICATIONS AND DOSE

Moderate to severe pain

BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child 12–17 years: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

Moderate to severe acute pain

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

POSTOPERATIVE pain

BY INTRAMUSCULAR INJECTION

Child 12–17 years: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

Moderate to severe pain (with modified-release 12-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Child 12–17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

Moderate to severe pain (with modified-release 24-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Child 12–17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

ZYDOL® XL

Moderate to severe pain

BY MOUTH USING MODIFIED-RELEASE TABLETS

Child 12–17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

CONTRA-INDICATIONS Acute intoxication with alcohol • acute intoxication with analgesics • acute intoxication with hypnotics • acute intoxication with opioids • not suitable for narcotic withdrawal treatment • uncontrolled epilepsy

CAUTIONS Excessive bronchial secretions • history of epilepsy—use tramadol only if compelling reasons • impaired consciousness • not suitable as a substitute in opioid-dependent patients • not suitable in some types of general anaesthesia • susceptibility to seizures—use tramadol only if compelling reasons

CAUTIONS, FURTHER INFORMATION

General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

INTERACTIONS Appendix 1: opioids

SIDE-EFFECTS

COMMON or very common Malaise

UNCOMMON Diarrhoea • flatulence • gastritis • retching

PREGNANCY Embryotoxic in animal studies—manufacturers advise avoid.

BREAST FEEDING Amount probably too small to be harmful, but manufacturer advises avoid.

HEPATIC IMPAIRMENT Caution (avoid for oral drops) in severe impairment.

RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral
Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**DIRECTIONS FOR ADMINISTRATION**

Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available in either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include Invodol® SR, Mabron®, Maneo®, Mabron, Maxitram® SR, Oldaram®, Tilodol® SR, Tramquel® SR, Tramulief® SR, Tradorec® XL, Zamadol® 24hr, and Zydol® XR®. Preparations that should be given 24-hourly include Tradorec XL®, Zamadol® 24hr, and Zydol® XR®.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets. Medicines for Children leaflet: Tramadol for pain

www.medicinesforchildren.org.uk/tramadol-for-pain

5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as paracetamol p. 260 (preferably in a soluble or dispersible form) or an NSAID, usually ibuprofen p. 625, is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as the 5HT1\(^-\) receptor agonist sumatriptan p. 279. Ergot alkaloids are associated with many side-effects and should be avoided.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1\(^-\) receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic–induced headache); therefore, increasing consumption of these medicines needs careful management.

5HT1\(^-\) receptor agonists

5HT1\(^-\) receptor agonists are used in the treatment of acute migraine attacks; treatment of children should be initiated by a specialist. A 5HT1\(^-\) receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT1\(^-\) receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

If a child does not respond to one 5HT1\(^-\) receptor agonist, an alternative 5HT1\(^-\) receptor agonist should be tried. For children who have prolonged attacks that frequently recur despite treatment with a 5HT1\(^-\) receptor agonist, combination therapy with an NSAID such as naproxen p. 631 can be considered. Sumatriptan and zolmitriptan p. 280 are used for migraine in children. They may also be of value in cluster headache.

Antiemetics

Antiemetics, including domperidone p. 251, phenothiazines, and antihistamines, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Domperidone has the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress should be sought; combined oral contraceptives may also provoke migraine. Preventive treatment should be considered if migraine attacks interfere with school and social life, particularly for children who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

In children it is often possible to stop prophylaxis after a period of treatment.

Propranolol hydrochloride p. 101 may be effective in preventing migraine in children but it is contra-indicated in those with asthma. Side-effects such as depression and postural hypotension can further limit its use.

Pizotifen p. 279, an antihistamine and a serotonin-receptor antagonist, may also be used but its efficacy in children has not been clearly established. Common side-effects include drowsiness and weight gain.

Topiramate is licensed for migraine prophylaxis.
Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray may be used. Treatment should be initiated by a specialist. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 628), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

**ANTIHISTAMINES** ▶ SEDATING

Paracetamol with buclizine hydrochloride and codeine phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 260, codeine phosphate p. 265.

- **INDICATIONS AND DOSE**
  - **MIGRALEVE®**
    - Acute migraine
      - **BY MOUTH**
        - Child 12-14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
        - Child 15-17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours
  - **INTERACTIONS** ▶ Appendix 1: antihistamines (sedating), opioids, paracetamol
  - **LESS SUITABLE FOR PRESCRIBING**
    - **MIGRALEVE®** Migraleve® is less suitable for prescribing.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 2
  - **Pizotifen (Non-proprietary)**
    - Pizotifen (as Pizotifen hydrogen malate) 500 microgram Pizotifen 500microgram tablets | 28 tablet £8.50 DT price = £2.03
    - Pizotifen (as Pizotifen hydrogen malate) 1.5 mg Pizotifen 1.5mg tablets | 28 tablet £8.50 DT price = £2.01

- **TRIPTANS**

  - **Sumatriptan**
    - **INDICATIONS AND DOSE**
      - **Treatment of acute migraine**
        - **BY MOUTH**
          - Child 6–9 years: Initially 25 mg for 1 dose, followed by 25 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)
          - Child 10-11 years: Initially 50 mg for 1 dose, followed by 50 mg after at least 2 hours, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)
          - Child 12-17 years: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)
        - **BY SUBCUTANEOUS INJECTION**
          - Child 10-17 years: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; maximum 12 mg per day
        - **BY INTRanasAL ADMINISTRATION**
          - Child 12-17 years: Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **CAUTIONS**
  - Avoid abrupt withdrawal - history of epilepsy - susceptibility to angle-closure glaucoma - urinary retention
  - **INTERACTIONS** ▶ Appendix 1: antihistamines (sedating)
  - **SIDE-EFFECTS**
    - **Common or very common** Dizziness - drowsiness - dry mouth - increased appetite - nausea - weight gain
    - **Uncommon** Constipation
    - **Rare** Aggression - anxiety - arthralgia - depression - hallucination - insomnia - myalgia - paraesthesia
    - **Very rare** Seizures
    - **Frequency not known** Hepatitis - jaundice - muscle cramps
  - **PREGNANCY** Avoid unless potential benefit outweighs risk.
  - **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Use with caution.
  - **RENAL IMPAIRMENT** Use with caution.

- **MEDICATIONS for children leaflet: Pizotifen to prevent migraine headaches** www.medicinesforchildren.org.uk/pizotifen-to-prevent-migraine-headaches

- **UNLICENSED USE** 1.5 mg tablets not licensed for use in children.
Treatment of acute cluster headache

- **BY SUBCUTANEOUS INJECTION**
  - Child 10–17 years (under expert supervision): Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using auto-injector; maximum 12 mg per day
- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years (under expert supervision): Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **CONTRA-INDICATIONS** Coronary vasospasm - ischaemic heart disease - mild uncontrolled hypertension - moderate and severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina
- **CAUTIONS** Conditions which predispose to coronary artery disease - history of seizures - mild, controlled hypertension - pre-existing cardiac disease - risk factors for seizures
- **INTERACTIONS** → Appendix 1: sumatriptan
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Dizziness - drowsiness - dyspnoea - fatigue - flushing - myalgia - nausia - sensory disturbances - transient increase in blood pressure - vomiting - weakness

- **SPECIFIC SIDE-EFFECTS**
  - **Common or very common** Dizziness - headache - palpitation - visual disturbances.

- **SIDE-EFFECTS, FURTHER INFORMATION** Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest — discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.
- **HEPATIC IMPAIRMENT** Reduce dose of oral therapy. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - **INDICATIONS AND DOSE**
    - **Treatment of acute migraine**
      - **BY MOUTH**
        - Child 12–17 years: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, if response unsatisfactory after 3 attacks consider increasing dose to 5 mg or switching to alternative treatment; maximum 10 mg per day
      - **BY INTRANASAL ADMINISTRATION**
        - Child 12–17 years: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

- **Treatment of acute cluster headache**
  - **BY INTRANASAL ADMINISTRATION**
    - Child 12–17 years: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. dose 5 mg in 24 hours with concurrent use of moderate and potent inhibitors of CYP1A2, cimetidine and moclobemide.
  - **DOSE EQUIVALENCE AND CONVERSION**
    - 1 spray of Zomig™ nasal spray = 5 mg zolmitriptan.

- **UNLICENSED USE** Not licensed for use in children.
Arrhythmias associated with accessory cardiac conduction pathways - ischaemic heart disease - previous cerebrovascular accident - transient ischaemic attack - uncontrolled hypertension - vasospasm - Wolff-Parkinson-White syndrome

Cautions

Patients or carers should be given advice on how to administer zolmitriptan orodispersible tablets.

Interactions

Appendix 1: zolmitriptan

Side-effects

General side-effects

- Frequency not known: Asthenia - dizziness
- Uncommon: Abdominal pain - drowsiness - dry mouth - dysphagia - headache - muscle weakness - myalgia - palpitation - paraesthesia
- Very rare: Angina - gastro-intestinal infarction - ischaemic colitis - myocardial infarction - splenic infarction
- With intranasal use: Epistaxis - taste disturbance

Specific side-effects

- With intranasal use: Epistaxis - taste disturbance

Side-effects, further information

- Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest - discontinue if intense, may be due to coronary vasocstriction or to anaphylaxis).

Pregnancy

There is limited experience of using 5HT1 receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

Breast feeding

Use with caution - present in milk in animal studies.

Hepatic impairment

Max. 5 mg in 24 hours in moderate or severe impairment.

Directions for administration

Zolmitriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed.

Patient and carer advice

 Patients or carers should be given advice on how to administer zolmitriptan orodispersible tablets.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Spray

- Zomig (AstraZeneca UK Ltd)
  - Zolmitriptan 50 mg per 1 ml: Zomig 5mg/0.1ml nasal spray 0.1ml unit dose | 6 unit dose (PM) £36.50 DT price = £36.50

5.2 Neuropathic pain

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes compression neuropathies, peripheral neuropathies (e.g. due to Diabetic complications p. 429, HIV infection p. 391, chemotherapy, trauma, idiopathic neuropathy, central pain (e.g. pain following spinal cord injury and syringomyelia), postherpetic neuralgia, and phantom limb pain. The pain may occur in an area of sensory deficit and may be described as burning, shooting or scalding; it may be accompanied by pain that is evoked by a nonnoxious stimulus (allodynia).

Children with chronic neuropathic pain require multidisciplinary management, which may include physiotherapy and psychological support. Neuropathic pain is generally managed with a tricyclic antidepressant such as amitriptyline hydrochloride p. 229 or antiepileptic drugs such as carbamazepine p. 189. Children with localised pain may benefit from topical local anaesthetic preparations, particularly while awaiting specialist review. Neuropathic pain may respond only partially to opioid analgesics. A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed 'atypical facial pain') and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain (unlicensed indication), but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Children on long-term therapy need to be monitored both for progress and for side-effects.

6 Sleep disorders

6.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Hypnotics and anxiolytics should be reserved for short courses to alleviate acute conditions after causal factors have been established.

The role of drug therapy in the management of anxiety disorders in children and adolescents is uncertain; drug therapy should be initiated only by specialists after psychosocial interventions have failed. Benzodiazepines and tricyclic antidepressants have been used but adverse effects may be problematic.

Hypnotics

The prescribing of hypnotics to children, except for occasional use such as for sedation for procedures is not justified. There is a risk of habituation with prolonged use. Problems settling children at night should be managed with behavioural therapy.
Dental procedures
Some anxious children may benefit from the use of a hypnotic the night before a dental appointment.

Chloral and derivatives
Chloral hydrate below and derivatives were formerly popular hypnotics for children. Chloral hydrate is now mainly used for sedation during diagnostic procedures.

Antihistamines
Some antihistamines such as promethazine hydrochloride p. 174 are used for occasional insomnia in adults; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects. The use of hypnotics in children is not usually justified.

Melatonin
Melatonin p. 283 is a pineal hormone that may affect sleep pattern. Clinical experience suggests that when appropriate behavioural sleep interventions fail, melatonin may be of value for treating sleep onset insomnia and delayed sleep phase syndrome in children with conditions such as visual impairment, cerebral palsy, attention deficit hyperactivity disorder, autism, and learning difficulties. It is also sometimes used before magnetic resonance imaging (MRI), computed tomography (CT), or EEG investigations. Little is known about its long-term effects in children, and there is uncertainty as to the effect on other circadian rhythms including endocrine or reproductive hormone secretion. The need to continue melatonin therapy should be reviewed every 6 months.

Anxiolytics
Anxiolytic treatment should be used in children only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery). Anxiolytic treatment should be limited to the lowest possible dose for the shortest possible time.

Buspirone
Buspirone hydrochloride is thought to act at specific serotonin (5HT1A) receptors; safety and efficacy in children have yet to be determined.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE

Chloral hydrate

- **INDICATIONS AND DOSE**
  - **Sedation for painless procedures**
    - **BY MOUTH, OR BY RECTUM**
      - **Neonate**: 30–50 mg/kg, to be given 45–60 minutes before procedure, doses up to 100 mg/kg may be used with respiratory monitoring, administration by rectum only if oral route not available.
      - **Child 1 month–11 years**: 30–50 mg/kg (max. per dose 1 g), to be given 45–60 minutes before procedure, administration by rectum only if oral route not available, increased if necessary up to 100 mg/kg (max. per dose 2 g).
      - **Child 12–17 years**: 1–2 g, to be given 45–60 minutes before procedure, administration by rectum only if oral route not available
    - **Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution**
      - **BY MOUTH USING ORAL SOLUTION**
      - **Child 2–11 years**: 1–1.75 mL/kilogram, alternatively 30–50 mg/kg once daily, dose to be taken with water or milk at bedtime; maximum 35 mL per day; maximum 1 g per day

- **Child 12–17 years**: 15–30 mL, alternatively 430–860 mg once daily, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day

- **Insomnia (short-term use), using chloral betaine 707 mg (**=** 414 mg chloral hydrate) tablets**
  - **BY MOUTH USING TABLETS**
  - **Child 12–17 years**: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

- **UNLICENSED USE** Not licensed for sedation for painless procedures.
- **CONTRA-INDICATIONS** Acute porphyrias p. 577 • gastritis • severe cardiac disease
- **CAUTIONS** Avoid contact with mucous membranes • avoid contact with skin • avoid prolonged use (and abrupt withdrawal thereafter) • reduce dose in debilitated
- **INTERACTIONS** > Appendix 1: chloral hydrate
- **SIDE-EFFECTS** Abdominal distention • delirium (especially on abrupt withdrawal) • dependence • excitement • flatulence • gastric irritation • headache • ketonuria • nausea • rash • tolerance • vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Risk of sedation in infant—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.
  - When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, enema
  - **Tablet**
  - **Chloral betaine (Non-proprietary)**
    - Chloral betaine 707 mg
      - 30 tablet (PSt) £138.59 DT price = £138.59
  - **Oral solution**
    - **Chloral hydrate (Non-proprietary)**
      - Chloral hydrate 28.66 mg per 1 ml
        - 150 ml (PSt) £244.25 DT price = £244.25

Melatonin

- INDICATIONS AND DOSE
  Sleep onset insomnia (initiated under specialist supervision) / Delayed sleep phase syndrome (initiated under specialist supervision)
  - BY MOUTH USING MODIFIED-RELEASE TABLETS
    - Child: Initially 2–3 mg daily for 1–2 weeks, then increased if necessary to 4–6 mg daily, dose to be taken before bedtime; maximum 10 mg per day

- UNLICENSED USE
  Not licensed for use in children.

- CAUTIONS
  Autoimmune disease (manufacturer advises avoid—no information available)

- INTERACTIONS
  - Appendix 1: melatonin

- SIDE-EFFECTS
  - Rare Aggression / arthritis / electrolyte disturbances / flatulence / gastritis / haematoma / halitosis / hot flushes / hypersalivation / hypervigilance / impaired memory / increased libido / lacrimation / leucopenia / mood changes / muscle spasm / nail disorder / palpitation / paraesthesia / polyuria / priapism / prostatitis / restless legs syndrome / syncope / thirst / thrombocytopenia / visual disturbances / vomiting
  - Frequency not known Galactorrhoea / mouth oedema / tongue oedema

- PREGNANCY
  No information available—avoid.

- BREAST FEEDING
  Present in milk—avoid.

- HEPATIC IMPAIRMENT
  Clearance reduced—avoid.

- RENAL IMPAIRMENT
  No information available—use with caution.

- PRESCRIBING AND DISPENSING INFORMATION
  Treatment with melatonin should be initiated and supervised by a specialist, but may be continued by general practitioners under a shared-care arrangement. The need to continue melatonin therapy should be reviewed every 6 months.

  Melatonin is available as a modified-release tablet (Circadin™) and also as unlicensed formulations. Unlicensed immediate-release preparations are available; the manufacturer should be specified in the shared-care guideline because of variability in clinical effect of unlicensed formulations.

- PATIENT AND CARER ADVICE
  Medicines for Children leaflet: Melatonin for sleep problems www.medicinesforchildren.org.uk/melatonin-for-sleep-disorders

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Modified-release tablet
  CAUTIONARY AND ADVISORY LABELS 2, 21, 25
  - Melatonin (Non-proprietary)
    Melatonin 3 mg Melatonin 3mg modified-release tablets
    120 tablet (58) no price available
  - Circadin (Flynn Pharma Ltd)
    Melatonin 2 mg Circadin 2mg modified-release tablets
    30 tablet (58) £15.39 DT price = £15.39

7 Substance dependence

Substance dependence

Guidance on treatment of drug misuse

Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. Nicotine replacement therapy is an effective aid to smoking cessation. The use of nicotine p. 284 replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some individuals benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations.

Concomitant medication

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline p. 162, and some antipsychotics (including clozapine p. 241, olanzapine p. 242, chlorpromazine hydrochloride p. 236, and haloperidol p. 237, may need to be reduced. Regular monitoring for adverse effects is advised.

Nicotine replacement therapy

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If the individual experiences strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

Side-effects of specific nicotine preparations

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral
preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patches, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of oral spray. Abnormal dreams can occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.

Neonatal abstinence syndrome
Neonatal abstinence syndrome occurs at birth as a result of intra-uterine exposure to opioids or high-dose benzodiazepines. Treatment is usually initiated if:
- feeding becomes a problem and tube feeding is required;
- there is profuse vomiting or watery diarrhoea;
- the baby remains very unsettled after two consecutive feeds despite gentle swaddling and the use of a pacifier.

Treatment involves weaning the baby from the drug on which it is dependent. Morphine p. 271 or methadone hydrochloride p. 286 can be used in babies of mothers who have been taking opioids. Morphine is widely used because the dose can be easily adjusted, but methadone hydrochloride may provide smoother control of symptoms. Weaning babies from benzodiazepines that have a long half-life is difficult to manage; chlorpromazine hydrochloride may be used in these situations but excessive sedation may occur. For babies who are dependent on barbiturates, phenobarbital p. 208 may be tried, although it does not control gastro-intestinal symptoms.

7.1 Nicotine dependence

NICOTINIC RECEPTOR AGONISTS

Nicotine

- INDICATIONS AND DOSE
  - Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day
    - BY MOUTH USING CHEWING GUM
      - Child 12-17 years: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose
    - BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
      - Child 12-17 years: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day
  - Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day
    - BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
      - Child 12-17 years: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose
  - Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day
    - BY INHALATION USING INHALATOR
      - Child 12-17 years: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily
    - BY MOUTH USING LOZENGES
      - Child 12-17 years: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; if attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day
    - BY MOUTH USING OROMUCOSAL SPRAY
      - Child 12-17 years: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day
    - BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
      - Child 12-17 years: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day
    - BY TRANSDERMAL APPLICATION USING PATCHES
      - Child 12-17 years: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6-8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6-8 weeks, followed by the low-strength patch for 2-4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2-4 weeks

- UNLICENSED USE All preparations are licensed for children over 12 years (with the exception of Nicotinell® lozenges
which are licensed for children under 18 years only when recommended by a doctor).

**CAUTIONS**

**GENERAL CAUTIONS**

Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment.

- Haemodynamically unstable patients hospitalised with cerebrovascular accident
- Haemodynamically unstable patients hospitalised with myocardial infarction
- Haemodynamically unstable patients hospitalised with severe arrhythmias
- Phaeochromocytoma
- Uncontrolled hyperthyroidism

**SPECIFIC CAUTIONS**

- When used by inhalation: Bronchospastic disease
- Chronic throat disease
- Obstructive lung disease
- With intranasal use: Bronchial asthma (may exacerbate)
- With oral use: Gastritis (can be aggravated by swallowed nicotine)
- Gum: may also stick to and damage dentures, oesophagitis (can be aggravated by swallowed nicotine).
- Peptic ulcers (can be aggravated by swallowed nicotine)
- With transdermal use: patches should not be placed on broken skin
- Patients with skin disorders

**CAUTIONS, FURTHER INFORMATION**

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

**SIDE-EFFECTS**

- **Common or very common**
  - Bloating
  - Blurred vision
  - Constipation
  - Coughing
  - Diarrhoea
  - Dry mouth
  - Dyspepsia
  - Dysphagia
  - Epistaxis
  - Flatulence
  - Gastritis
  - Gastrointestinal disturbances (may be caused by swallowed nicotine)
  - Hiccup
  - Increased saliva
  - Irritation of the throat—mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine
  - Minor skin irritation
  - Mouth ulcers
  - Nasal irritation
  - Nausea
  - Oesophagitis
  - Paraesthesia
  - Sneezing
  - Vomiting
  - Watery eyes

- **Uncommon**
  - Gingival bleeding
  - Halitosis
  - Thirst

- **Rare**
  - Arrhythmia

- **Very rare**
  - Reversible atrial fibrillation

- **Frequency not known**
  - Abdominal pain
  - Abnormal dreams (may occur with patches, removal of the patch before bed may help)
  - Arthralgia
  - Chest pain
  - Flatulence
  - Hot flushes
  - Myalgia
  - Palpitations
  - Rash
  - Sweating
  - Taste disturbance
  - Ulcerative stomatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Nicotine replacement therapy, under Substance dependence p. 283 for further details on individual preparations.

- **Nicotine withdrawal**
  - Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms.
  - Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza—like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

- **PREGNANCY**
  - The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

- **BREAST FEEDING**
  - Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

- **HEPATIC IMPAIRMENT**
  - Use with caution in moderate to severe hepatic impairment.

- **RENAL IMPAIRMENT**
  - Use with caution in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.
  - Administration by transdermal patch
  - Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.
  - Administration by nasal spray
  - Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.
  - Administration by oral spray
  - The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.
  - Administration by sublingual tablet
  - Each tablet should be placed under the tongue and allowed to dissolve.
  - Administration by lozenge
  - Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.
  - Administration by inhalation
  - Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.
  - Administration by medicated chewing gum
  - Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

- **PATIENT AND CARER ADVICE**
  - Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Spray**

**EXCIPIENTS:** May contain Ethanol

- **Nicotine (Non-proprietary)**
  - Nicotine 500 microgram per 1 actuation
    - Nicotine 10 mg/ml nasal spray | 10 ml
    - no price available
    - DT price = £13.80
  - **Brands may include NicAssist, Nicorette, Nicorette QuickMist**

**Sublingual tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - Nicotine (as Nicotine cyclodextrin complex) 2 mg
  - Nicotine 2 mg sublingual tablets sugar-free | 100 tablet
    - no price available
    - DT price = £13.12
  - **Brands may include NicAssist, Nicorette Microbat**
**Opioids**

**Methadone hydrochloride**

- **Indications and dose**
  - Neonatal opioid withdrawal
    - **By mouth**
      - **Neonate:** Initially 100 micrograms/kg, then increased in steps of 50 micrograms/kg every 6 hours until symptoms are controlled, doses may vary, consult local guidelines, for maintenance, total daily dose that controls symptoms to be given in 2 divided doses.

- **Medication form**
  - Syrup
  - Transdermal
  - Oral solution
  - Transdermal patch
  - Oral suspensions
  - Oral solutions
  - Lozenges
  - Medicated chewing gum
  - Inhalation vapour

- **Contra-indications**
  - Phaeochromocytoma

- **Caution**
  - Family history of sudden death (ECG monitoring recommended)
  - History of cardiac conduction abnormalities

- **Medicinal forms**

- **Prescribing and dispensing information**
  - Flavours of oral liquid formulations may include tolu.

- **Special hazard**
  - For children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

- **Renal impairment**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **Treatment cessation**
  - Avoid abrupt withdrawal. When used for neonatal opioid withdrawal, reduce dose over 7–10 days.

- **Directions for administration**
  - Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

2 Bacterial infection

Antibacterials, principles of therapy

07-Mar-2017

Choice of a suitable drug
Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies
Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or paediatric infectious diseases specialist.

Before starting therapy
The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;

Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);

The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;

The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections often require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate (e.g. in neonates and young children). Whenever possible, painful intramuscular injections should be avoided in children;

Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Superinfection
In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. fungal infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy
When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

Switching from parenteral to oral treatment
The ongoing parenteral administration of an antibacterial should be reviewed regularly. In older children it may be possible to switch to an oral antibacterial; in neonates and infants this should be done more cautiously because of the relatively high incidence of bacteraemia and the possibility of variable oral absorption.

Prophylaxis
In most situations, only a short course of prophylactic antibacterial is needed. Longer-term antibacterial prophylaxis is appropriate in specific indications such as vesico-ureteric reflux.

Notifiable diseases
Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Note
It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Sepsis, early management

Children aged up to 17 years with suspected community-acquired sepsis of any cause should be treated with ceftriaxone p. 308. If the child is already in hospital or is known to have previously been infected or colonised with ceftriaxone-resistant bacteria, an alternative antibiotic should be chosen following local guidelines. Children younger than 3 months should also receive an additional antibiotic that is active against listeria (such as ampicillin p. 326 or amoxicillin p. 325).

Neonates who are in hospital with suspected sepsis within 72 hours of birth, should be treated with intravenous benzylpenicillin sodium p. 323 and gentamicin p. 299. Community-acquired sepsis in neonates (who are more than 40 weeks corrected gestational age) should be treated with ceftriaxone p. 308, unless already receiving an intravenous calcium infusion. Neonates aged 40 weeks corrected gestational age or below, or receiving an intravenous calcium infusion, should receive cefotaxime p. 307, dosed according to age.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the child’s lactate concentration, systolic blood pressure (in children over 12 years) and their risk of severe illness or death. Children at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Children with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment,
taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury.

Antibacterials, use for prophylaxis

16-Mar-2017

Prevention of recurrence of rheumatic fever
- Phenoxymethylpenicillin p. 324 by mouth or erythromycin p. 316 by mouth.

Prevention of secondary case of invasive group A streptococcal infection
- Phenoxymethylpenicillin by mouth.

If child penicillin allergic, either erythromycin by mouth or azithromycin p. 314 by mouth [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Prevention of secondary case of meningococcal meningitis
- Ciprofloxacin p. 333 by mouth [unlicensed indication] or rifampicin p. 349 by mouth or ceftriaxone p. 308 by intramuscular injection [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of Haemophilus influenzae type b disease
- Rifampicin by mouth or if rifampicin cannot be used) ceftriaxone by intramuscular injection, or by intravenous injection, or by intravenous infusion [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive Haemophilus influenzae type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive Haemophilus influenzae type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against Haemophilus influenzae type b disease.

Prevention of secondary case of diphtheria in non-immune patient
- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 315) by mouth.

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

Prevention of pertussis
- Clarithromycin (or azithromycin or erythromycin) by mouth.

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
- Phenoxymethylpenicillin by mouth.

If cover also needed for H. influenzae in child give amoxicillin p. 325 instead.

If penicillin-allergic, erythromycin by mouth. Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Prevention of Staphylococcus aureus lung infection in cystic fibrosis
- Primary prevention, flucloxacillin p. 330 by mouth.
- Secondary prevention, flucloxacillin by mouth.

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive
- See Close contacts and Chemoprophylaxis for latent tuberculosis under Tuberculosis p. 345.

Prevention of urinary-tract infection
- Trimethoprim p. 344 by mouth or nitrofurantoin p. 354 by mouth.

Antibacterial prophylaxis can be considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

Prevention of infection from animal and human bites
- Co-amoxiclav p. 328 alone (or clindamycin p. 313 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 745 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.
Prevention of infection in gastro-intestinal procedures

Operations on stomach or oesophagus
- Single dose of i/v gentamicin p. 299 or i/v cefuroxime p. 306 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  Add i/v teicoplanin p. 311 (or vancomycin p. 312) if high risk of meticillin-resistant Staphylococcus aureus.

Open biliary surgery
- Single dose of i/v cefuroxime + i/v metronidazole p. 319 or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
  Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus.

Resections of colon and rectum, and resections in inflammatory bowel disease, and appendicectomy
- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
  Add i/v teicoplanin (or vancomycin) p. 311 (or vancomycin p. 312) if high risk of meticillin-resistant Staphylococcus aureus.

Endoscopic retrograde cholangiopancreatography
- Single dose of i/v gentamicin p. 299 or oral or i/v ciprofloxacin p. 333.
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
- Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 325 or i/v teicoplanin (or vancomycin).

Percutaneous endoscopic gastrostomy or jejunostomy
- Single dose of i/v co-amoxiclav p. 328 or i/v cefuroxime p. 306.
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
- Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus.

Prevention of infection in orthopaedic surgery

Closed fractures
- Single dose of i/v cefuroxime or i/v flucloxacillin p. 330 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 319 or i/v clindamycin p. 313 alone if history of allergy to penicillins or to cephalosporins.
- Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).
  At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).
  At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin and i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

High lower-limb amputation
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.
- Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
- Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.
  Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Prevention of infection in obstetric surgery

Termination of pregnancy
- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
- If genital chlamydial infection cannot be ruled out, give doxycycline p. 338 postoperatively.

Prevention of infective endocarditis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008, updated 2016)
- Chlorhexidine mouthwash is not recommended for the prevention of infective endocarditis in at risk children undergoing dental procedures.
- Antibacterial prophylaxis is not routinely recommended for the prevention of infective endocarditis in children undergoing dental procedures.
- While these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose children to the adverse effects of antimicrobials when the evidence of benefit has not been proven.
- Any infection in children at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.
- If children at risk of infective endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive...
appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Children at risk of infective endocarditis should be:
- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and
- advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endotheialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibacterial prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibacterials when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibacterials to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibacterial prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, bacterial

Antibacterial therapy for septicaemia: community-acquired
- Child 1 month–18 years, aminoglycoside + amoxicillin p. 325 (or ampicillin p. 326) or cefotaxime p. 307 (or ceftriaxone p. 308) alone
- If pseudomonas or resistant micro-organisms suspected, use a broad-spectrum antipseudomonal beta-lactam antibacterial.
- If anaerobic infection suspected, add metronidazole p. 319.
- If Gram-positive infection suspected, add flucloxacillin p. 330 or vancomycin p. 312 (or teicoplanin p. 311).
- Suggested duration of treatment at least 5 days.

Antibacterial therapy for septicaemia: hospital-acquired
- Child 1 month–18 years, a broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 322, ticarcillin with clavulanic acid p. 323, imipenem with cilastatin p. 302, or meropenem p. 302)
- If pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis, add aminoglycoside.
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to a broad-spectrum cephalosporin.
- Suggested duration of treatment at least 5 days.

Septicaemia related to vascular catheter
- Vancomycin (or teicoplanin)
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by Staphylococcus aureus, pseudomonas, or Candida species.

Meningococcal septicaemia
If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 323 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime may be an alternative in penicillin allergy; chloramphenicol p. 340 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 333, or rifampicin p. 349, or ceftriaxone may be used.

Antibacterial therapy for septicaemia in neonates
- Neonate less than 72 hours old, benzylpenicillin sodium + gentamicin p. 299
- If Gram-negative septicaemia suspected, use benzylpenicillin sodium + gentamicin + cefotaxime; stop benzylpenicillin sodium if Gram-negative infection confirmed.
- Suggested duration of treatment usually 7 days.
- Neonate more than 72 hours old, flucloxacillin + gentamicin or amoxicillin (or ampicillin) + cefotaxime
- Suggested duration of treatment usually 7 days.

Cardiovascular system infections, bacterial

Antibacterial therapy for endocarditis: initial ‘blind’ therapy
- Flucloxacillin p. 330 (or benzylpenicillin sodium p. 323 if symptoms less severe) + gentamicin p. 299
- If cardiac prostheses present, or if penicillin–allergic, or if meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 312 + rifampicin p. 349 + gentamicin

Antibacterial therapy for endocarditis caused by staphylococci
- Flucloxacillin
- Add rifampicin for at least 2 weeks in prosthetic valve endocarditis
- Suggested duration of treatment at least 4 weeks (at least
6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin
- **Suggested duration of treatment** at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

### Antibacterial therapy for native-valve endocarditis caused by fully-sensitive streptococci (e.g. viridans streptococci)
- Benzylpenicillin sodium
- **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)
- If aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, benzylpenicillin sodium + gentamicin
- **Suggested duration of treatment** 4 weeks
- If penicillin-allergic, vancomycin
- **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)

### Antibacterial therapy for native-valve endocarditis caused by less-sensitive streptococci
- Benzylpenicillin sodium + gentamicin
- **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)
- If amoxicillin-resistant and if streptococci moderately sensitive to penicillin, benzylpenicillin sodium + gentamicin
- **Suggested duration of treatment** 4 weeks
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin p. 311) + gentamicin
- **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)

### Antibacterial therapy for prosthetic valve endocarditis caused by streptococci
- Benzylpenicillin sodium + gentamicin
- **Suggested duration of treatment** at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
- **Suggested duration of treatment** at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)

### Antibacterial therapy for endocarditis caused by enterococci (e.g. *Enterococcus faecalis*)
- Amoxicillin p. 325 (or ampicillin p. 326) + gentamicin
- If gentamicin-resistant, substitute gentamicin with streptomycin p. 299
- **Suggested duration of treatment** at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
- If gentamicin-resistant, substitute gentamicin with streptomycin
- **Suggested duration of treatment** at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

### Antibacterial therapy for endocarditis caused by *Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella* species (‘HACEK’ micro-organisms)
- Amoxicillin (or ampicillin) + gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 308 + gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

## Central nervous system infections, bacterial

### Antibacterial therapy for meningitis: initial empirical therapy
- Transfer patient to hospital urgently.
- If *meningococcus disease* (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 323 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 307 may be an alternative in penicillin allergy; chloramphenicol p. 340 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 419, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.
- In hospital, if aetiology unknown:
  - **Neonate and child** 1–3 months, cefotaxime (or ceftriaxone p. 308) + amoxicillin p. 325 (or ampicillin p. 326)
  - Consider adding vancomycin p. 312 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
  - **Suggested duration of treatment** at least 14 days
- **Child** 3 months–18 years cefotaxime (or ceftriaxone)
- Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
- **Suggested duration of treatment** at least 10 days

### Antibacterial therapy for meningitis caused by group B streptococcus
- Benzylpenicillin sodium + gentamicin p. 299 or cefotaxime (or ceftriaxone) alone
- **Suggested duration of treatment** at least 14 days; stop gentamicin after 5 days

### Antibacterial therapy for meningitis caused by *meningococcus*
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- **Suggested duration of treatment** 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- **Suggested duration of treatment** 7 days.

### Antibacterial therapy for meningitis caused by pneumococci
- Cefotaxime (or ceftriaxone)
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of
antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).

- If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 349.
- *Suggested duration of antibacterial treatment* 14 days.

**Antibacterial therapy for meningitis caused by *Haemophilus influenzae***

- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - *Suggested duration of antibacterial treatment* 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - *Suggested duration of antibacterial treatment* 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

**Antibacterial therapy for meningitis caused by *Listeria***

- Amoxicillin (or ampicillin) + gentamicin
  - *Suggested duration of treatment* 21 days.
  - Consider stopping gentamicin after 7 days.
  - If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 335
  - *Suggested duration of treatment* 21 days.

**Ear infections, bacterial**

**Antibacterial therapy for otitis externa**

For topical treatments, consider *Otitis externa*, under Ear p. 660.

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

- Flucloxacillin p. 330
  - If *penicillin-allergic*, clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316).
  - If *pseudomonas suspected*, ciprofloxacin p. 333 (or an aminoglycoside).

**Antibacterial therapy for otitis media**

Many infections are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

- Amoxicillin p. 325 (or ampicillin p. 326)
  - Consider co-amoxiclav p. 328 if no improvement after 48 hours.

- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 306.
  - *Suggested duration of treatment* 5 days (longer if severely ill).
  - If *penicillin-allergic*, clarithromycin (or azithromycin or erythromycin)
  - *Suggested duration of treatment* 5 days (longer if severely ill)

**Eye infections, bacterial**

**Antibacterial therapy for purulent conjunctivitis**

- Chloramphenicol eye drops p. 648.

**Antibacterial therapy for congenital chlamydial conjunctivitis**

- Erythromycin p. 316 (by mouth)
  - *Suggested duration of treatment* 14 days.

**Antibacterial therapy for congenital gonococcal conjunctivitis**

- Cefotaxime p. 307 (or ceftriaxone p. 308)
  - *Suggested duration of treatment* single dose.

**Gastro-intestinal system infections, bacterial**

**Antibacterial therapy for gastro-enteritis**

Frequently self-limiting and may not be bacterial.

- Antibacterial not usually indicated.

**Antibacterial therapy for campylobacter enteritis**

Frequently self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316)
- Alternative, ciprofloxacin p. 333
  - Strains with decreased sensitivity to ciprofloxacin isolated frequently

**Antibacterial therapy for salmonella (non-typhoid)**

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised children, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin or cefotaxime p. 307

**Antibacterial therapy for shigellosis**

Antibacterial not indicated for mild cases.

- Azithromycin or ciprofloxacin
- Alternatives if *micro-organism sensitive*, amoxicillin p. 325 or trimethoprim p. 344

**Antibacterial therapy for typhoid fever**

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime (or ceftriaxone p. 308)
  - azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant microorganisms
- Alternative if *micro-organism sensitive*, ciprofloxacin or chloramphenicol p. 340
Antibacterial therapy for *Clostridium difficile* infection

- For first episode of mild to moderate infection, oral metronidazole p. 319
  - Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in children intolerant of metronidazole, oral vancomycin p. 312
  - Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin, or for life-threatening infection, or in patients with leucon, oral vancomycin + i/v metronidazole
  - Suggested duration of treatment 10–14 days

**Antibacterial therapy for peritonitis**

- A cephalosporin + metronidazole or amoxicillin + gentamicin p. 299 + metronidazole or piperacillin with tazobactam p. 322 alone

**Antibacterial therapy for peritonitis: peritoneal dialysis-associated**

- Vancomycin (or teicoplanin p. 311) + ceftazidime p. 307 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
  - Suggested duration of treatment 14 days or longer

**Antibacterial therapy for necrotising enterocolitis in neonates**

- In neonates
  - Benzylpenicillin sodium p. 323 + gentamicin + metronidazole or amoxicillin (or ampicillin p. 326) + gentamicin + metronidazole or amoxicillin (or ampicillin) + cefotaxime + metronidazole

**Genital system infections, bacterial**

**Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**

Contact tracing recommended.

- Child under 12 years, erythromycin p. 316
  - Suggested duration of treatment 14 days
- Child 12–18 years, azithromycin p. 314 as a single dose or doxycycline p. 338 for 7 days
  - Alternatively, erythromycin for 14 days

**Antibacterial therapy for gonorrhoea: uncomplicated**

Contact tracing recommended. Consider chlamydia co-infection. Choice of antibacterial depends on locality where infection acquired.

- Child under 12 years, single-dose of ceftiraxone p. 308
- Child 12–18 years, single-dose of cefixime p. 307
  - Alternatively, if micro-organism sensitive, single-dose of ciprofloxacin p. 333
- Child 12–18 years with pharyngeal infection, single-dose of ceftiraxone

**Antibacterial therapy for pelvic inflammatory disease**

Contact tracing recommended.

- Child 2–12 years, erythromycin + metronidazole p. 319 + single-dose of i/m ceftiraxone
  - Suggested duration of treatment 14 days (except i/m ceftiraxone)
- Child 12–18 years, doxycycline + metronidazole + single-dose of i/m ceftiraxone
  - If severely ill, seek specialist advice.
  - Suggested duration of treatment 14 days (except i/m ceftiraxone)

**Antibacterial therapy for syphilis**

Contact tracing recommended.

- Child under 12 years, benzylpenicillin sodium p. 323 or procaine benzylpenicillin [unlicensed]
  - Suggested duration of treatment 10 days

**Early syphilis (infection of less than 2 years)**

- Child 12–18 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment single-dose (repeat dose after 7 days for females in the third trimester of pregnancy)
  - Alternatively, doxycycline or erythromycin
  - Suggested duration of treatment 14 days

**Late latent syphilis (asymptomatic infection of more than 2 years)**

- Child 12–18 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment once weekly for 2 weeks
  - Alternatively, doxycycline
  - Suggested duration of treatment 28 days

**Asymptomatic contacts of patients with infectious syphilis**

- Child 12–18 years, doxycycline
  - Suggested duration of treatment 14 days

**Antibacterial therapy for neonatal congenital syphilis**

- Benzylpenicillin sodium
  - Also consider treating neonates with suspected congenital syphilis whose mothers were treated inadequately for syphilis, or whose mothers were treated for syphilis in the 4 weeks before delivery, or whose mothers were treated with non-penicillin antibacterials for syphilis.
  - Suggested duration of treatment 10 days

**Musculoskeletal system infections, bacterial**

**Antibacterial therapy for osteomyelitis**

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 330
  - Consider adding fusidic acid p. 342 or rifampicin p. 349 for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection
  - If penicillin-allergic, clindamycin p. 313
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection
  - If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin p. 312 (or teicoplanin p. 311)
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection

**Antibacterial therapy for septic arthritis**

Seek specialist advice if prostheses present.
Flucloxacillin

> **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).

If *penicillin-allergic*, clindamycin

> **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).

If *meticillin-resistant Staphylococcus aureus* suspected, vancomycin (or teicoplanin)

> **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).

If *gonococcal arthritis* or *Gram-negative infection suspected*, cefotaxime p. 307 (or ceftriaxone p. 308)

> **Suggested duration of treatment** 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

---

**Nose infections, bacterial**

**Antibacterial therapy for sinusitis**

Antibacterial therapy should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 325 (or ampicillin p. 326) or clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316)

> **Suggested duration of treatment** 7 days.

- Consider oral co-amoxiclav p. 328 if no improvement after 48 hours.

- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 306 may be required.

---

**Oral bacterial infections**

**Antibacterial drugs**

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 319 may sometimes be helpful for the treatment of severe oral infections or oral infections.

**Penicillins**

Phenoxyethylpenicillin p. 324 is effective for dentoalveolar abscess.

**Broad-spectrum penicillins**

Ampicillin p. 325 is as effective as phenoxyethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxyethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Co-amoxiclav p. 328 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

**Cephalosporins**

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 304 and cefadroxil p. 305 have been used in the treatment of oral infections.

**Tetracyclines**

In children over 12 years of age, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 338 has a longer duration of action than tetracycline p. 339 or oxytetracycline p. 339 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

**Macrolides**

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

**Clindamycin**

Clindamycin p. 313 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin p. 316-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

**Metronidazole and tinidazole**

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is
allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and perioral infections; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in perioral infections. Tinidazole p. 320 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, bacterial

**Antibacterial therapy for Haemophilus influenzae epiglottitis**
- Cefotaxime p. 307 (or ceftriaxone p. 308)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 340

**Antibacterial therapy for pneumonia: community-acquired**
Children under 2 years with mild symptoms of lower respiratory tract infection (particularly those vaccinated with pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 763 and haemophilus type b conjugate vaccine) are unlikely to have pneumonia; antibacterial treatment may be considered if symptoms persist.
- Neonate, benzylpenicillin sodium p. 323 + gentamicin p. 299
- Child 1 month–18 years, amoxicillin p. 325 (or ampicillin p. 326) by mouth
- Pneumococci with decreased penicillin sensitivity have been isolated in the UK, but are not common.
- If no response to treatment, add clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316)
- If staphylococci suspected (e.g. in influenza or measles), give by mouth amoxicillin + flucloxacillin p. 330 or co-amoxiclav p. 328 alone
- If septicaemia, complicated pneumonia, or if oral administration not possible, initiate treatment with i/v amoxicillin or i/v co-amoxiclav or i/v cefuroxime p. 306 or i/v cefotaxime (or ceftriaxone)
- **Suggested duration of treatment** 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)
- Child 1 month–18 years, if penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
- **Suggested duration of treatment** 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)

**Antibacterial therapy for pneumonia possibly caused by atypical pathogens**
- Clarithromycin (or azithromycin or erythromycin)
- **Suggested duration of treatment** 10–14 days
- **Alternative for chlamydial or mycoplasma infections in children over 12 years**, doxycycline p. 338
- **Suggested duration of treatment** 10–14 days

**Antibacterial therapy for pneumonia: hospital-acquired**
- Early-onset infection (less than 5 days after admission to hospital), treat as for severe community-acquired pneumonia of unknown aetiology; if life-threatening infection, or if recent history of antibacterial treatment, or if resistant organisms suspected, treat as for late-onset hospital-acquired pneumonia
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 322) or another antipseudomonal beta-lactam
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 312.
- If severe illness caused by *Pseudomonas aeruginosa*, add an aminoglycoside.
- **Suggested duration of treatment** 7 days (longer if *Pseudomonas aeruginosa* confirmed)

**Antibacterial therapy for staphylococcal lung infection in cystic fibrosis**
- Flucloxacillin
- If child already taking flucloxacillin prophylaxis or if severe exacerbation, add fusidic acid p. 342 or rifampicin p. 349; use flucloxacillin at treatment dose
- If penicillin-allergic, clarithromycin (or azithromycin or erythromycin) or clindamycin p. 313
- Use clarithromycin only if micro-organism sensitive

**Antibacterial therapy for Haemophilus influenzae lung infection in cystic fibrosis**
- Amoxicillin or a broad-spectrum cephalosporin
- In severe exacerbation use a third-generation cephalosporin (e.g. cefotaxime)

**Antibacterial therapy for pseudomonal lung infection in cystic fibrosis**
- Ciprofloxacin p. 333 + nebulised colistimethate sodium p. 331
- For severe exacerbation, an antipseudomonal beta-lactam antibacterial + parenteral tobramycin p. 300

Skin infections, bacterial

**Antibacterial therapy for impetigo: small areas of skin infected**
Seek local microbiology advice before using topical treatment in hospital.
- Topical fusidic acid p. 342
- **Suggested duration of treatment** 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant *Staphylococcus aureus*, topical mupirocin p. 668
- **Suggested duration of treatment** 7 days is usually adequate (max. 10 days).

**Impetigo: widespread infection**
- Oral flucloxacillin p. 330
- If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 324
- **Suggested duration of treatment** 7 days.
- If penicillin-allergic, oral clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316)
- **Suggested duration of treatment** 7 days.

**Antibacterial therapy for erysipelas**
- Phenoxymethylpenicillin or benzylpenicillin sodium p. 323
- If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
- **Suggested duration of treatment** at least 7 days
- If penicillin-allergic, clindamycin p. 313 or clarithromycin (or azithromycin or erythromycin)
- **Suggested duration of treatment** at least 7 days.
Antibacterial therapy for cellulitis

- Flucloxacillin (high dose)
  - If streptococcal infection confirmed, replace flucloxacillin with penicillinase-resistant penicillin or benzylpenicillin sodium
  - If Gram-negative bacteria or anaerobes suspected (e.g. facial, orbital infection, or infection caused by animal or human bites), use broad-spectrum antibacterials; if periumbilical cellulitis, use flucloxacillin + gentamicin p. 299
- If penicillin–allergic, clindamycin or clarithromycin (or azithromycin or erythromycin)
  - If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Antibacterial therapy for staphylococcal scalded skin syndrome

- Flucloxacillin
  - Suggested duration of treatment 7–10 days.
- If penicillin–allergic, clarithromycin (or azithromycin or erythromycin)
  - Suggested duration of treatment 7–10 days.

Antibacterial therapy for animal and human bites

Cleanse wound thoroughly. For tetanus–prone wound, give human tetanus immunoglobulin p. 745 (with a tetanus–containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries; assess risk of infection. Consider prophylaxis for bites from animals in endemic countries; assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

- Co-amoxiclav p. 328
- If penicillin–allergic, clindamycin

Antibacterial therapy for surgical wound infection

- Flucloxacillin or co-amoxiclav

Antibacterial therapy for paronychial or ‘septic spots’ in neonate

- Flucloxacillin
  - If systemically unwell, add an aminoglycoside.

ANTIBACTERIALS > AMINOGLYCOSIDES

Aminoglycosides

Overview

These include amikacin p. 298, gentamicin p. 299, neomycin sulfate p. 662, streptomycin p. 299, and tobramycin p. 300. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against Pseudomonas aeruginosa; streptomycin is active against Mycobacterium tuberculosis and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 319 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin–resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum–gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin–resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against Ps. aeruginosa but shows less activity against certain other Gram-negative bacteria.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uremic, cumulation may occur with resultant ototoxicity.

Cystic fibrosis

A higher dose of parenteral aminoglycoside is often required in children with cystic fibrosis because renal clearance of the aminoglycoside is increased. Aminoglycosides have a role in the treatment of pseudomonal lung infections in cystic fibrosis. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin–free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and has largely superseded multiple–daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children with endocarditis or burns of more than 20% of the total body surface area. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum–aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Neonates

As aminoglycosides are eliminated principally via the kidney, neonatal treatment must reflect the changes in glomerular filtration that occur with increasing gestational and postnatal age. The extended interval dose regimen is used in neonates, and serum–aminoglycoside concentrations must be measured. In patients on single daily dose regimens it may become necessary to prolong the dose interval to more than 24 hours if the trough concentration is high.

Aminoglycosides (by injection)

- CONTRA-INDICATIONS Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- CAUTIONS Care must be taken with dosage (the main side-
Effects of the aminoglycosides are dose-related; conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside - whenever possible, parenteral treatment should not exceed 7 days.

### Side-effects

- **Rare** Antibiotic-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
- **Very rare** Blood disorders - CNS effects - convulsions - encephalopathy - headache

- **Frequency not known** Auditory damage - impaired neuromuscular transmission - irreversible otoxicity - nephrotoxicity - transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery - vestibular damage

#### Side-effects, Further Information

- **Pregnancy** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.
  
  If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **Renal Impairment** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment.

  A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

  Otoxicity and nephrotoxicity occur commonly in patients with renal failure. Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

- **Monitoring Requirements**
  
  - **Serum concentrations** Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.

  Serum aminoglycoside concentrations must be determined in neonates.

  In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen.

  Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.

  - **Renal function should be assessed before starting an aminoglycoside and during treatment.**

  - **Auditory and vestibular function should also be monitored during treatment.**

### Amikacin

#### Indications and Dose

**Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)**

- **By slow intravenous injection**
  
  - Child: 1 month–11 years: 7.5 mg/kg every 12 hours, to be administered over 3–5 minutes
  
  - Child 12–17 years: 7.5 mg/kg every 12 hours; increased to 7.5 mg/kg every 8 hours (max. per dose 500 mg every 8 hours) for up to 10 days, higher dose to be used in severe infection, to be administered over 3–5 minutes; maximum 15 g per course

**Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)**

- **By intravenous infusion, or by intravenous injection**
  
  - Child: Initially 15 mg/kg adjusted according to plasma-concentration monitoring, not to be used for endocarditis or meningitis, dose to be adjusted according to serum-amikacin concentration, intravenous injection to be administered over 3–5 minutes

**Neonatal sepsis (extended interval dose regimen)**

- **By slow intravenous injection, or by intravenous infusion**
  
  - Neonate: 15 mg/kg every 24 hours, intravenous injection to be administered over 3–5 minutes.

**Neonatal sepsis (multiple daily dose regimen)**

- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  
  - Neonate: Loading dose 10 mg/kg, then 7.5 mg/kg every 12 hours, intravenous injection to be administered over 3–5 minutes.

**Pseudomonal lung infection in cystic fibrosis**

- **By slow intravenous injection, or by intravenous infusion**
  
  - Child: 10 mg/kg every 8 hours (max. per dose 500 mg every 8 hours), intravenous injection to be administered over 3–5 minutes

#### Doses at Extremes of Body-Weight

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely.

- **Unlicensed Use** Dose for cystic fibrosis not licensed.

- **Interactions** → Appendix 1: aminoglycosides

- **Side-effects**

- **Uncommon** Rash

- **Monitoring Requirements**

  - **Multiple daily dose regimen**: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre.

  - **Once daily dose regimen**: pre-dose ('trough') concentration should be less than 5 mg/litre.

- **Directions for Administration** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 30–60 minutes.

- **Prescribing and Dispensing Information** Local guidelines may vary in the dosing advice provided.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  
  - **Amikacin (Non-proprietary)**
    
    Amikacin (as Amikacin sulfate) 250 mg per 1 ml
    
    500mg/2ml solution for injection vials | 5 vial | £60.00
  
  - **Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)**
    
    Amikacin (as Amikacin sulfate) 50 mg per 1 ml
    
    Amikin 100mg/2ml solution for injection vials | 5 vial | £10.33
Gentamicin

**INDICATIONS AND DOSE**

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis

- **BY INTRavenous infusion**
  - Child: Initially 7 mg/kg, to be given in a once daily regimen (not suitable for endocarditis or meningitis), subsequent doses adjusted according to serum-gentamicin concentration
  - **BY INTRamuscular injection**, or **BY SLOW INTRavenous INJECTION**
  - Child 1 month-11 years: 2.5 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes
  - Child 12-17 years: 2 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

**Neonatal sepsis**

- **BY SLOW INTRavenous injection, or BY INTRavenous INFUSION**

- **Neonate up to 7 days**: 5 mg/kg every 36 hours, to be given in an extended interval dose regimen.

- **Neonate 7 days to 28 days**: 5 mg/kg every 24 hours, to be given in an extended interval dose regimen.

**Pseudomonal lung infection in cystic fibrosis**

- **BY SLOW INTRavenous injection, or BY INTRavenous INFUSION**
  - Child: 3 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

**Bacterial ventriculitis and CNS infection (supplement to systemic therapy) (administered on expert advice)**

- **BY INTRathecal injection, or BY INTRAVentricular injection**

- **Neonate**: (consult local protocol).

- **Child**: Initially 1 mg daily, then increased if necessary to 5 mg daily, seek specialist advice

**DosEs AT Extremes Of Body-WeIGHT**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

**INTERACTIONS** → Appendix 1: aminoglycosides

**SIDE-EFFECTS**

- Common or very common Rash

**MONITORING REQUIREMENTS**

- Extended interval dose regimen in neonates: pre-dose (‘trough’) concentration should be less than 2 mg/litre (less than 1 mg/litre if more than 3 doses administered); consider monitoring one hour (‘peak’) concentration in neonates with poor response to treatment, with oedema, with Gram-negative infection, or with birth-weight greater than 4.5 kg (consider increasing dose if ‘peak’ concentration less than 8 mg/litre in severe sepsis).
  - Once daily dose regimen: pre-dose (‘trough’) concentration should be less than 1 mg/litre.
  - Multiple daily dose regimen: one hour (‘peak’) serum concentration should be 5–10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
  - Multiple daily dose regimen for endocarditis: one hour (‘peak’) serum concentration should be 3–5 mg/litre; pre-dose (‘trough’) concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be determined twice each week (more often in renal impairment).
  - Multiple daily dose regimen for cystic fibrosis: one hour (‘peak’) serum concentration should be 8–12 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.

**DIRECTIONS FOR ADMINISTRATION**

- **For intrathecal or intraventricular injection**, use preservative-free intrathecal preparations only.
  - **For intravenous infusion**, dilute in Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

- Local guidelines may vary in the dosing advice provided.
  - Only preservative-free intrathecal preparation should be used.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule (PO) £36.28 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule (PO) £11.25 Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial (PO) £11.25 DT price = £11.25
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial (PO) £20.00 Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule (PO) £6.88 | 10 ampoule (PO) £10.00
  - Cidomycin (Sanofi)
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial (PO) £6.88
  - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule (PO) £6.88

**Infusion**

- **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags | 20 bag (PO) £39.00 Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags | 20 bag (PO) £119.00 Gentamicin 360mg/120ml infusion bags | 20 bag (PO) £169.00

---

Streptomycin

**INDICATIONS AND DOSE**

Tuberculosis, resistant to other treatment, in combination with other drugs

- **BY DEEP INTRAMUScular injection**
  - Child: 15 mg/kg once daily (max. per dose 1 g)

**ADJUNCT TO DOXYCYCLINE IN BRUCELLOSIS (ADMINISTERED ON EXPERT ADVICE)**

- **BY DEEP INTRAVENous injection**
  - Child: 5–10 mg/kg every 6 hours, total daily dose may alternatively be given in 2–3 divided doses

**UNLICENSED USE**

- Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

- Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

**INTERACTIONS** → Appendix 1: aminoglycosides

**SIDE-EFFECTS**

- Common or very common Rash
- Frequency not known Hypersensitivity reactions · paraesthesia of mouth
300 Bacterial infection

- **RENAL IMPAIRMENT** Should preferably be avoided. If essential, use with great care and consider dose reduction.

- **MONITORING REQUIREMENTS**
  - One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection

### Tobramycin

#### INDICATIONS AND DOSE

**Chronic Pseudomonas aeruginosa infection in patients with cystic fibrosis**
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 6–17 years: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
  - **BY INHALATION OF POWDER**
  - Child 6–17 years: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

**Pseudomonal lung infection in cystic fibrosis**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 8–10 mg/kg daily in 3 divided doses, to be given as a multiple daily dose regimen over 3–5 minutes
  - **BY INTRAVENOUS INFUSION**
  - Child: Initially 10 mg/kg once daily (max. per dose 660 mg), to be given over 30 minutes, subsequent doses adjusted according to serum-tobramycin concentration

**Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Pneumonia in hospital patients**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 2–2.5 mg/kg every 8 hours, to be given as a multiple daily dose regimen over 3–5 minutes
  - Child 12–17 years: 1 mg/kg every 8 hours, to be given as a multiple daily dose regimen over 3–5 minutes; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, to be given in severe infections as a multiple daily dose regimen over 3–5 minutes, dose to be reduced back to 3 mg/kg as soon as clinically indicated
  - **BY INTRAVENOUS INFUSION**
  - Child: Initially 7 mg/kg, to be given as a once daily dose regimen, subsequent doses adjusted according to serum-tobramycin concentration

**Neonatal sepsis**
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 32 weeks corrected gestational age: 4–5 mg/kg every 36 hours, to be given as an extended interval dose regimen, intravenous injection to be given over 3–5 minutes.
  - Neonate 32 weeks corrected gestational age and above: 4–5 mg/kg every 24 hours, to be given as an extended interval dose regimen, intravenous injection to be given over 3–5 minutes.
  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 2 mg/kg every 12 hours, to be given as a multiple daily dose regimen.

- **Neonate 7 days to 28 days**: 2–2.5 mg/kg every 8 hours, to be given as a multiple daily dose regimen.

#### DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

**VANTOBRA® NEBULISER SOLUTION**

**Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis**
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 6–17 years: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

#### SIDE-EFFECTS

- **Common or very common**
  - When used by inhalation Malaise | rhinitis | tinnitus
  - When used by intravenous infusion Rash
  - When used by inhalation Aphonia | hearing loss
  - Frequency not known
  - When used by inhalation Dysphonia

#### INTERACTIONS
- **Common or very common**
  - With concomitant intravenous aminoglycosides

#### CAUTIONS
- **When used by inhalation** Conditions characterised by muscular weakness—may impair neuromuscular transmission | history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of ototoxicity | renal impairment—limited information available | severe haemoptysis—risk of further haemorrhage

#### SIDE-EFFECTS, FURTHER INFORMATION
- **Frequency not known**
- **When used by inhalation** Bronchospasm | cough (more frequent by inhalation of powder) | dysphonia | epistaxis | haemoptysis | laryngitis | mouth ulcers | pharyngitis | salivary hypersecretion | taste disturbances

#### MONITORING REQUIREMENTS
- **Extended interval dose regimen in neonates**: pre-dose (‘trough’) concentration should be less than 2 mg/litre.
  - **Once daily dose regimen**: pre-dose (‘trough’) concentration should be less than 1 mg/litre.
  - Multiple daily dose regimen: one-hour (‘peak’) serum concentration should not exceed 10 mg/litre (8–12 mg/litre in cystic fibrosis); pre-dose (‘trough’) concentration should be less than 2 mg/litre.
When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 20–60 minutes.
- When used by inhalation Other inhaled drugs should be administered before tobramycin.

**PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in dosing advice provided.

**PATIENT AND CARER ADVICE** Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

**VANTOBRA® NEBULISER SOLUTION**
- Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**
- Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
- Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an adequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Tobramycin (Non-proprietary)**
  - Tobramycin (as Tobramycin sulfate) 40 mg per 1 ml Tobramycin 40mg/1ml solution for injection vials | 10 vial (PMD) £37.00 (Hospital only)
  - Tobramycin 80mg/2ml solution for injection vials | 5 vial (PMD) £20.80 | 10 vial (PMD) £37.72 | 10 vial (PMD) £47.00 (Hospital only)
  - Tobramycin 240mg/6ml solution for injection vials | 1 vial (PMD) £19.20
- **Nebcin (Flinn Pharma Ltd)**
  - Tobramycin (as Tobramycin sulfate) 40 mg per 1 ml Nebcin 80mg/2ml solution for injection vials | 1 vial (PMD) £5.37

**Nebuliser liquid**
- **Bramitob (Chesi Ltd)**
  - Tobramycin 75 mg per 1 ml Bramitob 300mg/4ml nebuliser solution 4ml ampoules | 56 ampoule (PMD) £117.00
- **TOBI (Novartis Pharmaceuticals UK Ltd)**
  - Tobramycin 60 mg per 1 ml Tobi 300mg/5ml nebuliser solution 5ml ampoules | 56 ampoule (PMD) £1,305.92 DT price = £1,305.92
- **Tymbrineb (Teva UK Ltd)**
  - Tobramycin 60 mg per 1 ml Tymbrineb 300mg/5ml nebuliser solution 5ml ampoules | 56 ampoule (PMD) £1,127.84 DT price = £1,305.92
- **Vantobra (Pari Medical Ltd)**
  - Tobramycin 100 mg per 1 ml Vantobra 170mg/1.7ml nebuliser solution 1.7ml ampoules | 56 ampoule (PMD) £1,305.00

**ANTIBACTERIALS > CARBAPENEMS**

**Carbapenems**

**Overview**
The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; imipenem (imipenem with cilastatin p. 302) and meropenem p. 302 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections caused by multiple-antibacterial resistant organisms (including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections).

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp*.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with *cilastatin* (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

**Ertapenem**

**INDICATIONS AND DOSE**
- **Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia**
  - By intravenous infusion
  - Child 3 months-12 years: 15 mg/kg every 12 hours; maximum 1 g per day
  - Child 13-17 years: 1 g once daily
- **Diabetic foot infections of the skin and soft-tissue**
  - By intravenous infusion
  - Child 13-17 years: 1 g once daily

**CAUTIONS**
- CNS disorders—risk of seizures

**INTERACTIONS**
- Appendix 1: carbapenems

**SIDE-EFFECTS**
- Common or very common Diarrhoea; headache; injection-site reactions; nausea; pruritus; raised platelet count; rash (also reported with eosinophilia and systemic symptoms); vomiting
- Uncommon Abdominal pain; anorexia; antibiotic-associated colitis; asthenia; bradycardia; chest pain; confusion; constipation; dizziness; dry mouth; dyspepsia; dysphonia; hypotension; melaena; oedema; petechiae; pharyngeal discomfort; raised glucose; seizures; sleep disturbances; taste disturbances
- Rare Agitation; anxiety; arrhythmia; blood disorders; cholecystitis; cough; depression; dysphagia; electrolyte disturbances; haemorrhage; hypoglycaemia; increase in blood pressure; jaundice; liver disorder; muscle cramp; nasal congestion; neutropenia; pelvic peritonitis; renal
Avoid if history of
Child 1 month
For
Neonate up to 7 days: Manufacturer advises avoid unless potential benefit outweighs risk.
Child 3 months
Neonate 21 days to 28 days: Bacterial infection
CNS disorders
1
Present in milk but unlikely to be
Neonate 7 days to 28 days: 10
Child 12
Positive Coombs
Child:
Reduce dose if estimated glomerular
Use with caution (risk of seizures);
Neonate 7 days to 28 days:

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Invanz®), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL. Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

BREAST FEEDING
Present in milk—manufacturer advises avoid.

RENAL IMPAIRMENT Use with caution (risk of seizures); avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION For intravenous infusion, or by intravenous injection

Imipenem with cilastatin

● INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicaemia
● BY INTRAVENOUS INFUSION
● Neonate up to 7 days: 20 mg/kg every 12 hours.
● Neonate 7 days to 20 days: 20 mg/kg every 8 hours.
● Neonate 21 days to 28 days: 20 mg/kg every 6 hours.
● Child 1–2 months: 20 mg/kg every 6 hours
● Child 3 months–17 years: 15 mg/kg every 6 hours (max. per dose 500 mg)
Infection caused by Pseudomonas or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection
● BY INTRAVENOUS INFUSION
● Child 3 months–17 years: 25 mg/kg every 6 hours (max. per dose 1 g)
Cystic fibrosis
● BY INTRAVENOUS INFUSION
● Child: 25 mg/kg every 6 hours (max. per dose 1 g)
DOSE EQUIVALENCE AND CONVERSION
● Dose expressed in terms of imipenem.

● UNLICENSED USE
Not licensed for use in children under 1 year; not licensed for use in children with renal impairment.

● CAUTIONS
CNS disorders - epilepsy

● SIDE-EFFECTS
● Common or very common Diarrhoea - eosinophilia - nausea (may reduce rate of infusion) - rash - vomiting

● Rare Acute renal failure - anaphylactic reactions - antibiotic-associated colitis - encephalopathy - hearing loss - hepatitis - paraesthesia - polyuria - Stevens-Johnson syndrome - taste disturbances - tooth, tongue or urine discoloration - toxic epidermal necrolysis - tremor

● Frequency not known
Neurotoxicity (at high dose, renal failure, CNS disease)

● ALLERGY AND CROSS-SENSITIVITY
Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies).

● BREAST FEEDING
Present in milk but unlikely to be absorbed.

● RECAL IMPAIRMENT
Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m², risk of CNS side-effects.

● EFFECT ON LABORATORY TESTS
Positive Coombs’ test.

● DIRECTIONS FOR ADMINISTRATION
For intravenous infusion dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

Meropenem

● INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicaemia
● BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
● Neonate up to 7 days: 20 mg/kg every 12 hours.
● Neonate 7 days to 28 days: 20 mg/kg every 12 hours.
● Child 1 month–11 years (body-weight up to 50 kg): 10–20 mg/kg every 8 hours
● Child 1 month–11 years (body-weight 50 kg and above): 0.5–1 g every 8 hours
● Child 12–17 years: 0.5–1 g every 8 hours
Severe aerobic and anaerobic Gram-positive and Gram-negative infections
● BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
● Neonate up to 7 days: 40 mg/kg every 12 hours.
● Neonate 7 days to 28 days: 40 mg/kg every 8 hours.
Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

- **BY INTRAVENOUS INFUSION**
- Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours
- Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours
- Child 12–17 years: 2 g every 8 hours

**Meningitis**

- **BY INTRAVENOUS INFUSION**
- Neonate up to 7 days: 40 mg/kg every 12 hours.
- Neonate 7 days to 28 days: 40 mg/kg every 8 hours
- Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours
- Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours
- Child 12–17 years: 2 g every 8 hours

**UNLICENSED USE** Not licensed for use in children under 3 months.

**INTERACTIONS** → Appendix 1: carbapenems

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, diarrhoea, disturbances in liver function tests, headache, nausea, pruritus, rash, thrombocytopenia, vomiting
- **Uncommon** Eosinophilia, leucopenia, paraesthesia, thrombocytopenia
- **Rare** Convulsions

**ALLERGY AND CROSS-SENSITIVITY** Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY** Use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).

**HEPATIC IMPAIRMENT** Monitor liver function in hepatic impairment.

**RENAL IMPAIRMENT** Use normal dose every 12 hours if estimated glomerular filtration rate 26–50 mL/minute/1.73 m². Use half normal dose every 12 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m². Use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS** Positive Coombs’ test.

**DIRECTIONS FOR ADMINISTRATION** Intravenous injection to be administered over 5 minutes.

Displacement value may be significant when reconstituting injection, consult local guidelines. For intravenous infusion, dilute reconstituted solution further to a concentration of 1–20 mg/mL in Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- Meropenem (Non-proprietary)
  - Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500 mg powder for solution for injection vials | 10 vial (Paxi) £80.75–£103.10 DT price = £80.75
  - Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1 g powder for solution for injection vials | 10 vial (Paxi) £206.28–£206.30

DT price = £161.18 (Hospital only) | 10 vial (Paxi) £161.18–£190.00 DT price = £161.18

- **Meropenem** (Pfizer Ltd)
  - Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500 mg powder for solution for injection vials | 10 vial (Paxi) £103.14 DT price = £80.75
  - Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1 g powder for solution for injection vials | 10 vial (Paxi) £206.28 DT price = £161.18

**ANTIBACTERIALS > CEPHALOSPORINS**

**Cephalosporins**

**Overview**

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 307 and ceftriaxone p. 308 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 307, cefotaxime, ceftazidime p. 307, ceftriaxone, or cefuroxime p. 306 can be used with caution; cefaclor p. 305, cefadroxil p. 304, cefalexin p. 304, and cefadine p. 305 should be avoided.

The orally active ‘first generation’ cephalosporins, cefalexin, cefadine, and cefadroxil and the ‘second generation’ cephalosporin, cefaclor have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. *Cefuroxime axetil*, an ester of the ‘second generation’ cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active ‘third generation’ cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefotaxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against *Gram*-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefazidime has good activity against pseudomonas. It is also active against other *Gram*-negative bacteria. Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall
bladder which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and should be avoided in neonates with unconjugated hyperbilirubinaemia, hypoalbuminaemia, acidosis or impaired bilirubin binding.

**Cephalosporins**

- **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.

- **SIDE-EFFECTS**
  - Rare Antibiotic-associated colitis

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
  - Cross-sensitivity with other beta-lactam antibacterials.
  - About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin.
  - Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs’ test.

**ANTIBACTERIALS CEPHALOSPORINS, FIRST-GENERATION**

**Cefadroxil**

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
  - Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

- **INTERACTIONS** Appendix 1: cephalosporins
- **PREGNANCY** Not known to be harmful.

- **CAUTIONARY AND ADVISORY LABELS**
  - Cefadroxil (Non-proprietary)
  - Cefadroxil (as Cefadroxil monohydrate) 500 mg. Cefadroxil 500 mg capsules | 20 capsule (POM) £22.38 DT price = £22.38 | 100 capsule (POM) £111.90

**Cefalexin (Cephalaxin)**

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
  - BY MOUTH
    - Neonate up to 7 days: 25 mg/kg twice daily (max. per dose 125 mg).
    - Neonate 7 days to 20 days: 25 mg/kg 3 times a day (max. per dose 125 mg).
    - Neonate 21 days to 28 days: 25 mg/kg 4 times a day (max. per dose 125 mg).
    - Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
    - Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
    - Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
    - Child 12-17 years: 500 mg 2–3 times a day
  - Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
  - BY MOUTH
    - Child 1 month-11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
    - Child 12-17 years: 1–1.5 g 3–4 times a day
  - Prophylaxis of recurrent urinary-tract infection
  - BY MOUTH
    - Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night

**INTERACTIONS** Appendix 1: cephalosporins

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT** Reduce dose in moderate impairment.

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS**
  - Cefalexin (Non-proprietary)
  - Cefalexin 25 mg per 1 ml. Cefalexin 125 mg/5 ml oral suspension sugar free sugar-free | 100 ml (POM) no price available
    - Cefalexin 125 mg/5 ml oral suspension 100 ml (POM) £4.90 DT price = £0.84
  - Cefalexin 50 mg per 1 ml. Cefalexin 250 mg/5 ml oral suspension sugar free sugar-free | 100 ml (POM) no price available
Cefadroxil is associated with protracted skin reactions, especially in children. It is contraindicated in patients with a history of immediate hypersensitivity reactions to cephalosporins. The drug is also associated with gastrointestinal reactions, especially in children.

Cefadroxil is a broad-spectrum antibiotic that is effective against a wide range of Gram-positive and Gram-negative bacteria. It is effective against S. pyogenes, S. pneumoniae, and S. aureus, as well as other Gram-positive bacteria. It is also effective against H. influenzae, N. meningitidis, and other Gram-negative bacteria.

Cefadroxil is primarily used for the treatment of ear, nose, and throat infections, as well as skin infections. It is also used for the prevention of endocarditis in patients with intravascular devices. Cefadroxil is available in oral form, including capsules, tablets, and oral suspension.

Cefadroxil is generally well tolerated, but it can cause gastrointestinal side effects, including nausea, vomiting, and diarrhea. It can also cause skin reactions, such as rash, itching, and hives.

Cefadroxil is classified as a third-generation cephalosporin, which means it is more effective against Gram-negative bacteria than first generation cephalosporins. It is also less likely to cause allergic reactions than first generation cephalosporins.

In conclusion, Cefadroxil is an effective and safe antibiotic for the treatment of a variety of infections. It is important to follow the guidelines for appropriate use and dosage to ensure the maximum effectiveness of the drug.

**Summary**
- Cefadroxil is a broad-spectrum antibiotic used for the treatment of ear, nose, and throat infections.
- It is also used for the prevention of endocarditis in patients with intravascular devices.
- Cefadroxil is generally well tolerated, but it can cause gastrointestinal side effects and skin reactions.
- It is classified as a third-generation cephalosporin.

**INDICATIONS AND DOSE**

### Susceptible infections due to Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
  - Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
  - Child 12-17 years: 250 mg twice daily, dose may be doubled in severe infection
- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Neonate up to 7 days: 25 mg/kg every 12 hours, increased if necessary to 50 mg/kg every 12 hours, increased dose used in severe infection
  - Neonate 7 days to 20 days: 25 mg/kg every 8 hours, increased if necessary to 50 mg/kg every 8 hours, increased dose used in severe infection
  - Neonate 21 days to 28 days: 25 mg/kg every 6 hours, increased if necessary to 50 mg/kg every 6 hours, increased dose used in severe infection
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis

### Lyme disease

- **BY MOUTH**
  - Child 3 months-11 years: 15 mg/kg twice daily (max. per dose 500 mg) for 14–21 days (for 28 days in Lyme arthritis)
  - Child 12-17 years: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

### Lower urinary-tract infection

- **BY MOUTH**
  - Child 12-17 years: 125 mg twice daily

### Surgical prophylaxis

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child: 50 mg/kg (max. per dose 1.5 g), to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 30 mg/kg every 8 hours (max. per dose 750 mg) if required for up to 3 doses (for high-risk procedures)

**UNLICENSED USE**

- With oral use Not licensed for treatment of Lyme disease in children under 12 years. Duration of treatment in Lyme disease is unlicensed.

**INTERACTIONS**

- Appendix 1: cephalosporins

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- Single doses over 750 mg should be administered by the intravenous route only.

- With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

Antibacterials > Cephalosporins, third-generation

Cefixime

- **INDICATIONS AND DOSE**
  
  **Acute infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **By mouth**
  - Child 6-11 months: 75 mg daily
  - Child 1-4 years: 100 mg daily
  - Child 5-9 years: 200 mg daily
  - Child 10-17 years: 200–400 mg daily, alternatively 100–200 mg twice daily

  **Uncomplicated gonorrhoea**
  - **By mouth**
  - Child 12-17 years: 400 mg for 1 dose

- **UNLICENSED USE** Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

- **INTERACTIONS** Appendix 1: cephalosporins

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  Cefixime 200 mg Suprax 200mg tablets | 7 tablet £13.23 DT price = £13.23

Cefotaxime

- **INDICATIONS AND DOSE**
  
  **Uncomplicated gonorrhoea**
  - **By intramuscular injection**
  - Child 12-17 years: 500 mg for 1 dose

  **Severe exacerbations of Haemophilus influenzae infection in cystic fibrosis**
  - **By intravenous injection, or by intravenous infusion**
  - Child: 50 mg/kg every 6–8 hours; maximum 12 g per day

  **Congenital gonococcal conjunctivitis**
  - **By intramuscular injection**
  
  - Neonate: 100 mg/kg (max. per dose 1 g) for 1 dose.

- **INFECTIONS DUE TO SENSITIVE GRAM-POSITIVE AND GRAM-NEGATIVE BACTERIA**
  
  Surgical prophylaxis | Haemophilus epiglottitis
  
  - **By intramuscular injection, or by intravenous injection, or by intravenous infusion**
  
  - Neonate up to 7 days: 25 mg/kg every 12 hours.
  
  - Neonate 7 days to 20 days: 25 mg/kg every 8 hours.
  
  - Neonate 21 days to 28 days: 25 mg/kg every 6–8 hours.
  
  - Child: 50 mg/kg every 8–12 hours

- **INTERACTIONS** Appendix 1: cephalosporins

- **SIDE-EFFECTS**
  
  - Rare: Arrhythmias (following rapid injection)

  **PREGNANCY** Not known to be harmful.

  **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

  **RENAL IMPAIRMENT** Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  
  - With intravenous use Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for injection**
  
  - Cefotaxime (Non-proprietary)

  Cefotaxime (as Cefotaxime sodium) 1 gram Cefotaxime 1g powder for solution for injection vials | 1 vial £3.00 | 10 vial £35.00

  Cefotaxime (as Cefotaxime sodium) 2 gram Cefotaxime 2g powder for solution for injection vials | 1 vial £6.00 | 10 vial £67.50

Ceftazidime

- **INDICATIONS AND DOSE**
  
  **Pseudomonal lung infection in cystic fibrosis**
  - **By intravenous infusion, or by intravenous injection, or by deep intramuscular injection**
  - Child: 50 mg/kg every 8 hours; maximum 9 g per day

  **Febrile neutropenia**
  - **By intravenous infusion, or by intravenous injection**
  - Child: 50 mg/kg every 8 hours; maximum 6 g per day

  **Meningitis**
  - **By intravenous infusion, or by intravenous injection**
  
  - Neonate up to 7 days: 50 mg/kg every 24 hours.

  - Neonate 7 days to 20 days: 50 mg/kg every 12 hours.

  - Neonate 21 days to 28 days: 50 mg/kg every 8 hours.

  - Child: 50 mg/kg every 8 hours; maximum 6 g per day

Continued →
Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- Neonate up to 7 days: 25 mg/kg every 24 hours.
- Neonate 7 days to 20 days: 25 mg/kg every 12 hours.
- Neonate 21 days to 28 days: 25 mg/kg every 8 hours.
- Child: 25 mg/kg every 8 hours; maximum 6 g per day

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- Neonate up to 7 days: 50 mg/kg every 24 hours.
- Neonate 7 days to 20 days: 50 mg/kg every 12 hours.
- Neonate 21 days to 28 days: 50 mg/kg every 8 hours.
- Child: 50 mg/kg every 8 hours; maximum 6 g per day

Chronic Burkhdereria cepacia infection in cystic fibrosis

- By inhalation of nebulised solution

UNLICENSED USE Nebulised route unlicensed.

INTERACTIONS → Appendix 1: cephalosporins

SIDE-EFFECTS Paraesthesia; taste disturbances

PREGNANCY Not known to be harmful.

BREAST FEEDING Present in milk in low concentration, but appropriate to use.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

RENAL IMPAIRMENT Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—consult product literature.

DIRECTIONS FOR ADMINISTRATION Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.

- With intravenous use Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute reconstituted solution further to a concentration of not more than 40 mg/mL in Glucose 5% or Glucose 10% or Sodium chloride 0.9%; give over 20–30 minutes.
- When used by inhalation For nebulisation, dissolve dose in 3 mL of water for injection.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

INDICATIONS AND DOSE

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections

- By intravenous infusion

- Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- Neonate 15 days to 28 days: 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- Child 9–11 years (body-weight 50 kg and above): 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- Child 12–17 years: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- By intravenous injection

- Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- Child 9–11 years (body-weight 50 kg and above): 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- Child 12–17 years: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- By deep intramuscular injection

- Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- Complicated skin and soft tissue infections | Infections of bones and joints

- By intravenous infusion

- Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- Child 1 month–11 years (body-weight up to 50 kg): 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
Suspected bacterial infection in neutropenic patients

- **Neonate up to 15 days:** 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Neonate 15 days to 28 days:** 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Child 1 month-11 years (body-weight 50 kg):** 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day

- **Child 9-11 years (body-weight 50 kg and above):** 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- **Child 12-17 years:** 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- **Bacterial meningitis | Bacterial endocarditis**

- **Neonate up to 15 days:** 50 mg/kg once daily.

- **Neonate 15 days to 28 days:** 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis.

- **Child 1 month-11 years (body-weight up to 50 kg):** 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day

- **Child 9-11 years (body-weight 50 kg and above):** 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- **Child 12-17 years:** 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

Surgical prophylaxis

- **Neonate up to 15 days:** 20–50 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure.

- **Neonate 15 days to 28 days:** 50–80 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure.

- **Child 1 month-11 years (body-weight up to 50 kg):** 50–80 mg/kg (max. per dose 4 g) for 1 dose, dose to be administered 30–90 minutes before procedure

- **Child 9-11 years (body-weight 50 kg and above):** 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

- **Child 12-17 years:** 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

- **Uncomplicated gonorrhoea | Pelvic inflammatory disease**

- **Neonate up to 15 days:** 50 mg/kg once daily for 10–14 days.

- **Neonate 15 days to 28 days:** 75–100 mg/kg once daily for 10–14 days.

- **Child 1 month-11 years (body-weight up to 50 kg):** 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day

- **Child 9-11 years (body-weight 50 kg and above):** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- **Child 12-17 years:** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- **Child 1 month-11 years (body-weight up to 50 kg):** 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day

- **Child 9-11 years (body-weight 50 kg and above):** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- **Child 12-17 years:** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- **Child 1 month-11 years (body-weight up to 50 kg):** 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day

- **Child 9-11 years (body-weight 50 kg and above):** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- **Child 12-17 years:** 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
### Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])

- **By Intravenous Infusion**
  - Neonate 15 days to 28 days: 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration.
  - Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration; maximum 4 g per day
  - Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration
  - Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

#### By Intravenous Injection

- Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration
- Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

#### By Deep Intramuscular Injection

- Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration; maximum 4 g per day
- Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration
- Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

### Prevention of secondary case of meningococcal meningitis

- **By Intramuscular Injection**
  - Child 1 month–11 years: 125 mg for 1 dose
  - Child 12–17 years: 250 mg for 1 dose

### Prevention of secondary case of *Haemophilus influenzae* type b disease

- **By Intravenous Infusion**
  - Child 1 month–11 years: 50 mg/kg daily (max. per dose 1 g) for 2 days

- **By Intramuscular Injection, or by Intravenous Injection, or by Intravenous Infusion**
  - Child 12–17 years: 1 g daily for 2 days

### Acute otitis media

- **By Deep Intramuscular Injection**
  - Child 1 month–11 years (body-weight up to 50 kg): 50 mg/kg for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
  - Child 9–11 years (body-weight 50 kg and above): 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
  - Child 12–17 years: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

### DIRECTIONS FOR ADMINISTRATION

- **With intravenous use** For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates)—may displace bilirubin from serum albumin. Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.
  - For intravenous injection, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.
  - With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
  - With intramuscular use For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular

### UNLICENSED USE

- Not licensed for prophylaxis of *Haemophilus influenzae* type b disease.
- Not licensed for prophylaxis of meningococcal meningitis.
- Not licensed for congenital gonococcal conjunctivitis.

### CONTRA-INDICATIONS

Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fetal reactions) · full-term neonates with jaundice, hypoalbuninaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy · premature neonates less than 41 weeks corrected gestational age

### CAUTIONS

History of hypercalcemia · history of kidney stones · use with caution in neonates

### INTERACTIONS

- Appendix 1: cephalosporins

### SIDE-EFFECTS

- Common or very common Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic · calcium ceftriaxone precipitate in urine (particularly in very young, dehydrated or those who are immobilised) — consider discontinuation if symptomatic
- Uncommon Genital fungal infection
- Rare Bronchospasm · glycosuria · haematuria · prolongation of prothrombin time
- Frequency not known Convulsion · glossitis · oliguria · pancreatitis · stomatitis · toxic epidermal necrolysis · vertigo

### PREGNANCY

Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. Specialist sources indicate suitable for use in pregnancy.

### BREAST FEEDING

Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant.

### RENAL IMPAIRMENT

Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily.

### MONITORING REQUIREMENTS

Manufacturer advises to monitor full blood count regularly during prolonged treatment.

### UNLICENSED USE

Not licensed for prophylaxis of meningococcal meningitis.

### CONTRA-INDICATIONS

Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fetal reactions) · full-term neonates with jaundice, hypoalbuninaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy · premature neonates less than 41 weeks corrected gestational age

### CAUTIONS

History of hypercalcemia · history of kidney stones · use with caution in neonates

### INTERACTIONS

Appendix 1: cephalosporins

### SIDE-EFFECTS

Common or very common Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic · calcium ceftriaxone precipitate in urine (particularly in very young, dehydrated or those who are immobilised) — consider discontinuation if symptomatic

Uncommon Genital fungal infection

Rare Bronchospasm · glycosuria · haematuria · prolongation of prothrombin time

Frequency not known Convulsion · glossitis · oliguria · pancreatitis · stomatitis · toxic epidermal necrolysis · vertigo

Pregnancy Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. Specialist sources indicate suitable for use in pregnancy.

### BREAST FEEDING

Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant.

### RENAL IMPAIRMENT

Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily.

### MONITORING REQUIREMENTS

Manufacturer advises to monitor full blood count regularly during prolonged treatment.

### DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates)—may displace bilirubin from serum albumin. Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.

For intravenous injection, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.

With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.

With intramuscular use For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular
Injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous infusion or intravenous injection (see above). Displacement value may be significant, consult local guidelines.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Ceftriaxone (Non-proprietary)**
  - Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial | £1.80 DT price = £2.40
  - Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial | £0.80 DT price = £1.40
  - Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial | £1.90 DT price = £2.40
  - Rocephin (Roche Products Ltd)
    - Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial | £2.40 DT price = £2.40
    - Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial | £0.80 DT price = £1.40
    - Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial | £1.90 DT price = £2.40

**ANTIBACTERIALS > GLYCOPEPIDE ANTIBACTERIALS**

**Teicoplanin**

**DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

**INDICATIONS AND DOSE**

**Surgical prophylaxis**

- **BY INTRAVENOUS INJECTION**
  - Child: (consult local protocol)

**Potentially serious Gram-positive infections including endocarditis, and serious infections due to *Staphylococcus aureus***

- **INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

  - Neonate: Initially 16 mg/kg for 1 dose, followed by (by intravenous infusion) 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose.

  - Child: Initially 10 mg/kg every 12 hours (max. per dose 400 mg) for 3 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 6 mg/kg once daily (max. per dose 400 mg). (After initial 3 doses subsequent doses can be given by intramuscular route, if necessary, although, intravenous route is preferable)

**Severe Gram-positive infections (including burns, septicemia, septic arthritis and osteomyelitis)**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: Initially 10 mg/kg every 12 hours for 3 doses, then 10 mg/kg once daily

**PHARMACOKINETICS**

Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE** Not licensed for surgical prophylaxis.

**SIDE-EFFECTS**

- **Common or very common** Pruritus - rash
- **Frequency not known** Exfoliative dermatitis - nephrotoxicity - renal failure - Stevens-Johnson syndrome - toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

Nephrotoxicity Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

**ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

**MONITORING REQUIREMENTS**

Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose (‘trough’) concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre.

- Blood counts and liver and kidney function tests required.

**DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5%; give over 30 minutes. Intermittent intravenous infusion preferred in neonates.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder and solvent for solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Targocid (Sanofi)**
  - Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial | £3.93
  - Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial | £7.32
Vancomycin

**DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

**INDICATIONS AND DOSE**

*Clostridium difficile* infection

- **By mouth**
  - Child 1 month–4 years: 5 mg/kg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 10 mg/kg 4 times a day
  - Child 5–11 years: 62.5 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 250 mg 4 times a day
  - Child 12–17 years: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day
  
**Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicemia and soft-tissue infections**

- **By intravenous infusion**
  - Neonate up to 29 weeks corrected gestational age: 15 mg/kg every 24 hours adjusted according to plasma-concentration monitoring.
  - Neonate 29 weeks to 35 weeks corrected gestational age: 15 mg/kg every 12 hours adjusted according to plasma-concentration monitoring.
  - Neonate 35 weeks corrected gestational age and above: 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring.
  
**Surgical prophylaxis (when high risk of MRSA)**

- **By intravenous infusion**
  - Child: (consult local protocol)
**CNS infection e.g. ventriculitis (administered on expert advice)**

- **By intraventricular administration**
  - Neonate: 10 mg every 24 hours.
  - Child: 10 mg every 24 hours, for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased, adjust dose according to CSF concentration after 3–4 days; aim for pre-dose (‘trough’) concentration less than 10 mg/litre. If CSF not draining free reduce dose frequency to once every 2–3 days
**Peritonitis associated with peritoneal dialysis**

- **By intraperitoneal administration**
  - Child: Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre
**Eradication of meticillin-resistant *Staphylococcus aureus* from the respiratory tract in cystic fibrosis**

- **By inhalation of nebulised solution**
  - Child: 4 mg/kg twice daily (max. per dose 250 mg) for 5 days, alternatively 4 mg/kg 4 times a day (max. per dose 250 mg) for 5 days

**PHARMACOKINETICS**

Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route. Not licensed for intraventricular use or inhalation. Not licensed for use by the intrathecal route for the treatment of meningitis.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

For intraventricular administration, seek specialist advice.

**CAUTIONS**

**GENERAL CAUTIONS**

Avoid if history of deafness

**SPECIFIC CAUTIONS**

- With oral use Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses

**INTERACTIONS** → Appendix 1: vancomycin

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rare**

- With intravenous use Agranulocytosis • Thrombocytopenia

**Frequency not known**

- With intravenous use Anaphylaxis • Cardiac arrest on rapid infusion • Chills • Dyspnoea • Eosinophilia • Exfoliative dermatitis • Fever • flushing of the upper body (‘red man’ syndrome) • Nausea • Pain and muscle spasm of back and chest • Phlebitis (irritant to tissue) • Pruritus • Rashes • Severe hypotension on rapid infusion • Shock on rapid infusion • Stevens–Johnson syndrome • Toxic epidermal necrolysis • Urticaria • Vasculitis • Wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

- Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

**ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

- Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

**BREAST FEEDING**

Present in milk—significantly lower than product literature.

**RENA1 IMPAIRMENT**

Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.

**MONITORING REQUIREMENTS**

- All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
- All patients require blood counts, urinalysis, and renal function tests.

**With intravenous use**

- Pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of meticillin-resistant *Staphylococcus aureus*).
- With intraventricular use Aim for pre-dose (‘trough’) concentration less than 10 mg/litre.
- When used by inhalation Measure lung function before and after initial dose of vancomycin and monitor for bronchospasm.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.

Displacement value may be significant, consult product.
literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/mL; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not available (limited evidence); 10 mg/mL can be used if infused via a central venous line over at least 1 hour.

- With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.
- When used by inhalation For nebulisation administer required dose in 4 mL of sodium chloride 0.9% (or water for injections). Administer inhaled bronchodilator before vancomycin.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pastille, solution for injection, infusion

**Powder for solution for infusion**

- **Vancomycin (Non-proprietary)**
  - Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial (PO) £7.25 | 10 vial (PO) £62.50
  - Vancomycin 500mg powder for concentrate for solution for infusion vials | 1 vial (PO) £8.50 | 10 vial (PO) £62.50
- **Vancomycin (as Vancomycin hydrochloride) 1 gram** Vancomycin 1g powder for solution for infusion vials | 1 vial (PO) £14.50 | 10 vial (PO) £125.00
  - Vancomycin 1g powder for concentrate for solution for infusion vials | 1 vial (PO) £17.25 | 10 vial (PO) £120.50
- **Vanocin** (Flynn Pharma Ltd)
  - Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial (PO) £6.25
  - Vancomycin (as Vancomycin hydrochloride) 1 gram Vancomycin 1g powder for solution for infusion vials | 1 vial (PO) £12.50

**Capsule**

- **Vancomycin (Non-proprietary)**
  - Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin 125mg capsules | 28 capsule (PO) £132.47 DT price = £132.47
  - Vancomycin (as Vancomycin hydrochloride) 250 mg Vancomycin 250mg capsules | 28 capsule (PO) £140.08 DT price = £140.08
- **Vanocin Matrigel** (Flynn Pharma Ltd)
  - Vancomycin (as Vancomycin hydrochloride) 125 mg Vanocin Matrigel 125mg capsules | 28 capsule (PO) £88.31 DT price = £132.47

### ABTIBACTERIALS > LINCOASAMIDES

**Clindamycin**

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

- **INDICATIONS AND DOSE**
  - Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)
  - **BY MOUTH**
    - Neonate up to 14 days: 3–6 mg/kg 3 times a day.
    - Neonate 14 days to 28 days: 3–6 mg/kg 4 times a day.
    - Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg).

- **SIDE-EFFECTS** Abdominal discomfort | Antibiotic-associated colitis | Diarrhoea (discontinue treatment) | Eosinophilia | Exfoliative dermatitis | Jaundice | Leucopenia | Malaria | Nausea | Oesophageal ulcers | Oesophagitis | Polyarthritis | Pruritus | Rash | Stevens-Johnson syndrome | Taste disturbances | Thrombocytopenia | Toxic epidermal necrolysis | Urticaria | Vesiculobullous dermatitis | Vomiting

- **CAUTIONS** Avoid acute porphyrias | Avoid in acute porphyrias

- **UNLICENSED USE** Not licensed for treatment of falciparum malaria.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates | Diarrhoeal states

- **CAUTIONS** Avoid in acute porphyrias | p. 577

- **INTERACTIONS** → Appendix 1: clindamycin

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Antibiotic-associated colitis
  - Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **MONITORING REQUIREMENTS** Monitor liver and renal function if treatment exceeds 10 days. Monitor liver and renal function in neonates and infants.

- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration. For intravenous infusion, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

- **PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

- **PROFESSION SPECIFIC INFORMATION** Dental practitioners’ formulary
  - Clindamycin capsules may be prescribed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion.

**Solution for injection**

- **EXCIPIENTS:** May contain Benzyl alcohol
- **Clindamycin (Non-proprietary)**
  - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Clindamycin 600mg/4ml solution for injection ampoules | 5 ampoule (PO) £61.75

### BACTERIAL INFECTION 313

**BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used for severe infections, total daily dose may alternatively be given in 3 divided doses, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

**Staphylococcal lung infection in cystic fibrosis**

- **BY MOUTH**
  - Child: 5–7 mg/kg 4 times a day (max. per dose 600 mg)

**Treatment of falciparum malaria (to be given with or following quinine)**

- **BY MOUTH**
  - Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
Clindamycin 300mg/2ml solution for injection ampoules | 5 ampoule (Po) £28.50-£31.01

- Dalacin C (Pfizer Ltd)
- Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 5 ampoule (Po) £31.01
- Dalacin C Phosphate 600mg/4ml solution for injection ampoules | 5 ampoule (Po) £61.75

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 27
- Clindamycin (Non-proproprietary)
- Clindamycin (as Clindamycin hydrochloride) 150 mg Clindamycin 150mg capsules | 24 capsule (Po) £13.72 DT price = £3.81 | 100 capsule (Po) £55.21
- Clindamycin (as Clindamycin hydrochloride) 300 mg Clindamycin 300mg capsules | 30 capsule (Po) £46.00 DT price = £39.65
- Dalacin C (Pfizer Ltd)
- Clindamycin (as Clindamycin hydrochloride) 75 mg Dalacin C 75mg capsules | 24 capsule (Po) £7.45 DT price = £7.45
- Clindamycin (as Clindamycin hydrochloride) 150 mg Dalacin C 150mg capsules | 24 capsule (Po) £13.72 DT price = £3.81 | 100 capsule (Po) £55.08

ANTIBACTERIALS ➔ MACROLIDES

Macrolides

Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 316 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against Haemophilus influenzae. Erythromycin causes nausea, vomiting, and diarrhea in some patients; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including H. influenzae. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 315 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for Helicobacter pylori eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 345.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

- CAUTIONS Electrolyte disturbances (predisposition to QT interval prolongation) - may aggravate myasthenia gravis - predisposition to QT interval prolongation

SIDE-EFFECTS

- Common or very common Abdominal discomfort - diarrhoea - nausea - vomiting
- Uncommon Cholestatic jaundice - hepatotoxicity - rash
- Rare Antibiotic-associated colitis - arrhythmias - pancreatitis - QT interval prolongation - Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known Reversible hearing loss (sometimes with tinnitus) can occur after large doses

With intravenous use Local tenderness - phlebitis

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

Azithromycin

INDICATIONS AND DOSE

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

- BY MOUTH
  - Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
  - Child 12-17 years: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

- BY MOUTH
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
  - Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

Infection in cystic fibrosis

- BY MOUTH
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days, repeated after 1 week to complete course, treatment may be repeated as necessary

Chronic Pseudomonas aeruginosa infection in cystic fibrosis

- BY MOUTH
  - Child 6-17 years (body-weight 25-40 kg): 250 mg 3 times a week
  - Child 6-17 years (body-weight 41 kg and above): 500 mg 3 times a week

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

- BY MOUTH
  - Child 12-17 years: 1 g for 1 dose

Lyme disease (under expert supervision)

- BY MOUTH
  - Child 6-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7–10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

- BY MOUTH
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7 days

UNLICENSED USE Not licensed for typhoid fever, Lyme disease, chronic Pseudomonas aeruginosa infection in cystic fibrosis, or prophylaxis of group A streptococcal infection.

INTERACTIONS ➔ Appendix 1: macrolides
### Clarithromycin

#### INDICATIONS AND DOSE

**Respiratory-tract infections**: Mild to moderate skin and soft-tissue infections | Otitis media

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

  - **Neonate**: 7.5 mg/kg twice daily.

    - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
    - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
    - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
    - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
    - Child 12–17 years (body-weight 30–40 kg): 250 mg twice daily
    - Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

  - Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)

- **BY INTRAVENOUS INFUSION**

  - Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours) maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
  - Child 12–17 years: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

**Lyme disease**

- **BY MOUTH**

  - Child 1 month–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg) for 14–21 days
  - Child 12–17 years: 500 mg twice daily for 14–21 days

**Prevention of pertussis**

- **BY MOUTH**

  - Neonate: 7.5 mg/kg twice daily for 7 days.

    - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
    - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
    - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
    - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
    - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
    - Child 12–17 years: 500 mg twice daily for 7 days

**Helicobacter pylori eradication in combination with omeprazole, and amoxicillin or metronidazole**

- **BY MOUTH**

  - Child 1–5 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
  - Child 6–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
  - Child 12–17 years: 500 mg twice daily

#### UNLICENSED USE

- Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months. Intravenous infusion not licensed for use in children under 12 years.

#### INTERACTIONS

- Appendix 1: macrolides

#### SIDE-EFFECTS

- Common or very common: Dyspepsia, headache, hyperhidrosis, insomnia, taste disturbances
Erythromycin

### INDICATIONS AND DOSE

**Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)**

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - Child 8–17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
- **BY INTRAVENOUS INFUSION**
  - Neonate: 10–12.5 mg/kg every 6 hours.
  - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Child: 12.5 mg/kg 4 times a day (max. per dose 500 mg) for 14–21 days

**Chlamydial ophthalmia**

- **BY MOUTH**
  - Neonate: 12.5 mg/kg every 6 hours.
  - Child: 125 mg 4 times a day, increased to 250 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses
  - Child 2–7 years: 250 mg 4 times a day, increased to 500 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses
  - Child 8–17 years: 250–500 mg 4 times a day, increased to 500–1000 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses

**Early syphilis**

- **BY MOUTH**
  - Child 12–17 years: 500 mg 4 times a day for 14 days

**Uncomplicated genital chlamydial Non-gonococcal urethritis**

- **BY MOUTH**
  - Child 1 month–1 year: 12.5 mg/kg 4 times a day for 14 days
  - Child 2–11 years: 250 mg twice daily for 14 days
  - Child 12–17 years: 500 mg twice daily for 14 days

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS** 9, 21, 25

- **Clarice XL** (Teva UK Ltd)
  - Clarithromycin 500 mg Clarice XL 500mg tablets | 7 tablet (PoM) £6.72 DT price = £6.72 | 14 tablet (PoM) £13.23
- **Klaricid XL** (Mylan Ltd)
  - Clarithromycin 500 mg Klaricid XL 500mg tablets | 7 tablet (PoM) £6.72 DT price = £6.72 | 14 tablet (PoM) £13.23
- **Xetinin XL** (Morningside Healthcare Ltd)
  - Clarithromycin 500 mg Xetinin XL 500mg tablets | 7 tablet (PoM) £6.72 DT price = £6.72 | 14 tablet (PoM) £13.23

**Granules**

**CAUTIONARY AND ADVISORY LABELS** 9, 13

- **Klaricid** (Mylan Ltd)
  - Clarithromycin 250 mg Klaricid Adult 250mg granules sachets | 14 sachet (PoM) £11.68

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 9

- **Clarithromycin (Non-proprietary)**
  - Clarithromycin 250 mg Clarithromycin 250mg tablets | 14 tablet (PoM) £10.50 DT price = £1.36
  - Clarithromycin 500 mg Clarithromycin 500mg tablets | 14 tablet (PoM) £21.50 DT price = £2.21

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 9

- **Clarithromycin (Non-proprietary)**
  - Clarithromycin 25 mg per 1 ml Clarithromycin 125mg/5ml oral suspension | 70 ml (PoM) £4.88 DT price = £4.06
  - Clarithromycin 50 mg per 1 ml Clarithromycin 250mg/5ml oral suspension | 70 ml (PoM) £7.08 DT price = £5.43
  - **Klaricid** (Mylan Ltd)
    - Clarithromycin 25 mg per 1 ml Klaricid Paediatric 125mg/5ml oral suspension | 70 ml (PoM) £5.26 DT price = £4.06 | 100 ml (PoM) £9.04
    - Clarithromycin 50 mg per 1 ml Klaricid Paediatric 250mg/5ml oral suspension | 70 ml (PoM) £10.51 DT price = £5.43
Pelvic inflammatory disease
- BY MOUTH
  - Child 1 month-1 year: 12.5 mg/kg 4 times a day for 14 days
  - Child 2-11 years: 250 mg twice daily for 14 days
  - Child 12-17 years: 500 mg twice daily for 14 days

Prevention and treatment of pertussis
- BY MOUTH
  - Neonate: 12.5 mg/kg every 6 hours.
  - Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
- BY INTRAVENOUS INFUSION
  - Neonate: 10–12.5 mg/kg every 6 hours.
  - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Prevention of secondary case of diphtheria in non-immune patient
- BY MOUTH
  - Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients
- BY MOUTH
  - Child 1 month-1 year: 125 mg every 6 hours for 10 days
  - Child 2-7 years: 250 mg every 6 hours for 10 days
  - Child 8-17 years: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)
- BY MOUTH
  - Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - Child 2-7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - Child 8-17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of recurrence of rheumatic fever
- BY MOUTH
  - Child 1 month-1 year: 125 mg twice daily
  - Child 2-17 years: 250 mg twice daily

Acne
- BY MOUTH
  - Child 1-3 months: 250 mg once daily, alternatively 125 mg twice daily
  - Child 12-17 years: 500 mg twice daily

Gastro-intestinal stasis
- BY MOUTH
  - Neonate: 3 mg/kg 4 times a day
- BY INTRAVENOUS INFUSION
  - Neonate: 3 mg/kg 4 times a day
  - Child 1-11 months: 3 mg/kg 4 times a day

- UNLICENSED USE Not licensed for use in gastro-intestinal stasis.
- CAUTIONS Avoid in acute porphyrias. 
- INTERACTIONS → Appendix 1: macrolides
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Only small amounts in milk—not known to be harmful.
- HEPATIC IMPAIRMENT May cause idiosyncratic hepatotoxicity.
- RENAL IMPAIRMENT Reduce dose in severe renal impairment (ototoxicity).
- DIRECTIONS FOR ADMINISTRATION Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary
Erythromycin tablets c/p may be prescribed. Erythromycin ethylsuccinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Aztreonam

**DRUG ACTION** Aztreonam is a monocyclic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**INDICATIONS AND DOSE**

**Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis***

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 30 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.
  - Child 1 month–11 years: 30 mg/kg every 6–8 hours
  - Child 12–17 years: 1 g every 8 hours, alternatively 2 g every 12 hours

**Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis***

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2.4 g 4 times a day)
  - Child 12–17 years: 2 g every 6–8 hours

**Antibacterials > Monobactams**

**Aztreonam**

**DRUG ACTION** Aztreonam is a monocyclic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**INDICATIONS AND DOSE**

**Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis***

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 30 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.
  - Child 1 month–11 years: 30 mg/kg every 6–8 hours
  - Child 12–17 years: 1 g every 8 hours, alternatively 2 g every 12 hours

**Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis***

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2.4 g 4 times a day)
  - Child 12–17 years: 2 g every 6–8 hours

**Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis***

- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 6–17 years: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS** Bronchospasm • rash
  
  **SPECIFIC SIDE-EFFECTS**

  **Frequency not known**
  - With intravenous use Antibiotic-associated colitis • asthenia • blood disorders • breast tenderness • chest pain • confusion • diplopia • dizziness • dyspnoea • gastro-intestinal bleeding • halitosis • headache • hepatitis • hypotension • insomnia • jaundice • myalgia • neutropenia • paraesthesia • seizures • thrombocytopenia • tinnitus

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

  Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

- **PREGNANCY**
  - With intravenous use No information available; manufacturer of injection advises avoid.
  - With intravenous use No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - With intravenous use Use injection with caution. Monitor liver function.

- **RENAL IMPAIRMENT**
  - With intravenous use If estimated glomerular filtration rate 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If estimated glomerular filtration rate less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

- **MONITORING REQUIREMENTS**
  - When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous injection*, give over 3–5 minutes. Displacement value of injection may be significant, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
  - When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.
### Metronidazole

#### INDICATIONS AND DOSE

**Anaerobic infections**

- **Child 1 month:** 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- **Child 2 months–11 years:** 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- **Child 12–17 years:** 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

**By Mouth**

- **Child 1–11 months:** 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- **Child 1–4 years:** 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- **Child 5–9 years:** 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- **Child 10–17 years:** 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

**By Rectum**

- **Child 1–11 months:** 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- **Child 1–4 years:** 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- **Child 5–9 years:** 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- **Child 10–17 years:** 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

**Loading dose**

- **Neonate up to 26 weeks corrected gestational age:** Loading dose 15 mg/kg, followed by 7.5 mg/kg after 24 hours, then 7.5 mg/kg usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).
- **Neonate 26 weeks to 34 weeks corrected gestational age:** Loading dose 15 mg/kg, followed by 7.5 mg/kg after 12 hours, then 7.5 mg/kg every 12 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).
- **Neonate 34 weeks corrected gestational age and above:** Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).

**By Intravenous infusion**

- **Child 1 month:** Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection)
- **Child 2 months–17 years:** 7.5 mg/kg every 8 hours (max. per dose 500 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

#### Helicobacter pylori eradication; in combination with clarithromycin and omeprazole

**By Mouth**

- **Child 1–5 years:** 100 mg twice daily
- **Child 6–11 years:** 200 mg twice daily
- **Child 12–17 years:** 400 mg twice daily

**Fistulating Crohn’s disease**

**By Mouth**

- **Child:** 7.5 mg/kg 3 times a day usually given for 1 month but should not be used for longer than 3 months because of concerns about peripheral neuropathy

**Pelvic inflammatory disease**

**By Mouth**

- **Child 12–17 years:** 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**

**By Mouth**

- **Child 1–2 years:** 50 mg every 8 hours for 3 days
- **Child 3–6 years:** 100 mg every 12 hours for 3 days
- **Child 7–9 years:** 100 mg every 8 hours for 3 days
- **Child 10–17 years:** 200–250 mg every 8 hours for 3 days

**Acute oral infections**

**By Mouth**

- **Child 1–2 years:** 50 mg every 8 hours for 3–7 days
- **Child 3–6 years:** 100 mg every 12 hours for 3–7 days
- **Child 7–9 years:** 100 mg every 8 hours for 3–7 days
- **Child 10–17 years:** 200–250 mg every 8 hours for 3–7 days

**Surgical prophylaxis**

**By Mouth**

- **Child 1 month–11 years:** 30 mg/kg (max. per dose 500 mg), to be administered 2 hours before surgery
- **Child 12–17 years:** 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

**By Rectum**

- **Child 5–9 years:** 500 mg, to be administered 2 hours before surgery, then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- **Child 10–17 years:** 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

**Neonate up to 40 weeks corrected gestational age and above:** 20–30 mg/kg, to be administered up to 30 minutes before the procedure.
Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered up to 30 minutes before the procedure.
Child 12–17 years: 500 mg, to be administered up to 30 minutes before the procedure, then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures).

**Invasive intestinal amoebiasis**
*Extra-intestinal amoebiasis (including liver abscess)*

**BY MOUTH**
- Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection).
- Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection).
- Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection).
- Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection).

**Established case of tetanus**
- **BY INTRAVENOUS INFUSION**
- Child: (consult product literature)

**INTERACTIONS**
- Appendix 1: metronidazole

**SIDE-EFFECTS**
- **Very rare**
  - Arthralgia
  - Ataxia
  - Darkening of urine
  - Dizziness
  - Drowsiness
  - Erythema multiforme
  - Headache
  - Hepatitis
  - Jaundice
  - Leucopenia
  - Pancreatitis
  - Pancrenoma
  - Peripheral neuropathy
  - Psychotic disorders
  - Rash
  - Thrombocytopenia
  - Transient epileptiform seizures
  - Visual disturbances

**FREQUENCY NOT KNOWN**
- Anorexia
- Aseptic meningitis
- Furred tongue
- Gastro-intestinal disturbances
- Nausea
- Optic neuropathy
- Oral mucositis
- Taste disturbances
- Vomiting

**PREGNANCY**
- Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

**HEPATIC IMPAIRMENT**
- In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.

**MONITORING REQUIREMENTS**
- Clinical and laboratory monitoring advised if treatment exceeds 10 days.

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion, give over 20–30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**
- Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections.

---

320 Bacterial infection

Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Metronidazole for bacterial infections: www.medicinesforchildren.org.uk/metronidazole-bacterial-infections

**PROFESSION SPECIFIC INFORMATION**
- **Dental practitioners’ formulary**
  - Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 4, 9, 21, 25, 27
- **Metronidazole (Non-proprietary)**
  - **Flagyl (Zentiva)**
    - **Flagyl 200 mg** Flagyl 200mg tablets | 21 tablet (P) £4.99 DT price = £2.65 | 250 tablet (P) £19.69
    - **Flagyl 400 mg** Flagyl 400mg tablets | 21 tablet (P) £7.95 DT price = £5.57
    - **Flagyl 500 mg** Flagyl 500mg tablets | 21 tablet (P) £37.82 DT price = £37.82

**Suppository**
- **CAUTIONARY AND ADVISORY LABELS** 4, 9
- **Flagyl (Zentiva)**
  - Metronidazole 500 mg Flagyl 500mg suppositories | 10 suppository (P) £15.18
  - Metronidazole 1 gram Flagyl 1g suppositories | 10 suppository (P) £23.06

**Oral suspension**
- **CAUTIONARY AND ADVISORY LABELS** 4, 9
- **Metronidazole (Non-proprietary)**
  - Metronidazole (as Metronidazole benzoate) 40 mg per 1 ml Metronidazole 200mg/5ml oral suspension | 100 ml (P) £32.93 DT price = £32.93

**Infusion**
- **ELECTROLYTES:** May contain Sodium

**Metronidazole (Non-proprietary)**
- **Metronidazole 200 mg** Metronidazole 200mg/5ml infusion | 100ml bags | 1 bag (P) no price available | 60 bags (P) no price available
- **Metronidazole 500 mg** Metronidazole 500mg/100ml infusion | 100ml bags | 1 bag (P) no price available | 60 bags (P) no price available

**Tinidazole**
- **DRUG ACTION**
  - Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

**INDICATIONS AND DOSE**

**Intestinal amoebiasis**
- **BY MOUTH**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
  - Child 12–17 years: 2 g once daily for 2–3 days

**Amoebic involvement of liver**
- **BY MOUTH**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
  - Child 12–17 years: 1.5–2 g once daily for 3–6 days

**Urogenital trichomoniasis**
- **Giardiasis**
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature)
- **Child 12-17 years**: 2 g for 1 single dose, dose may be repeated once if necessary

- **CAUTIONS** Avoid in acute porphyrias p. 577
- **INTERACTIONS** ▶ Appendix 1: tinidazole
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia · furred tongue · gastro-intestinal disturbances · nausea · oral mucositis · taste disturbances · vomiting
  - **Very rare** Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances
  - **Frequency not known** Aseptic meningitis · optic neuropathy
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet** CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25
  - Fasigyn (Pfizer Ltd)
    - Tinidazole 500 mg Fasigyn 500mg tablets | 16 tablet  | £11.04
    - DT price = £11.04

- **ANTIBACTERIALS** ▶ **PENICILLINS**

  **Penicillins**

  **Benzylpenicillin and phenoxymethylpenicillin**

  Benzylpenicillin sodium p. 323 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease in children. It is also used in combination with gentamicin p. 299 for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 319 is preferred. Benzylpenicillin sodium is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

  Benzathine benzylpenicillin or procaine benzylpenicillin are used in the treatment of syphilis.

  Phenoxymethylpenicillin p. 324 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid–stable, so is suitable for oral administration. It should not be used for infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

  **Penicillinase-resistant penicillins**

  Most staphylococci are now resistant to benzylpenicillin sodium because they produce penicillinases. Flucloxacillin p. 330, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

  **Broad-spectrum penicillins**

  Ampicillin p. 326 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Ampicillin is also active against *Listeria* spp. and enterococci. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

  Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

  Amoxicillin p. 325 is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

  Amoxicillin or ampicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections. They are also used in the treatment of endocarditis and listerial meningitis. Amoxicillin may also be used for the treatment of Lyme disease [not licensed]. Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in children with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

  Co-amoxiclav p. 328 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase–producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase–producing strains.

  A combination of ampicillin with flucloxacillin (as co-fluampicil p. 327) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

  **Antipseudomonal penicillins**

  Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 322 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 323 and it is
more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary-tract, skin and soft tissue, or intra-abdomen. They may be used for the empirical treatment of septicaemia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin) since they have a synergistic effect.

Piperacillin with tazobactam is used in cystic fibrosis for the treatment of *P. aeruginosa* colonisation when ciprofloxacin p. 333 and nebulised colistimethate sodium p. 331 have been ineffective; it can also be used in infective exacerbations, when it is combined with an aminoglycoside.

**Mecillinams**

Pivmecillinam hydrochloride p. 330 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

**Penicillins**

- **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.
- **CAUTIONS** History of allergy
- **SIDE-EFFECTS**
  - **Common or very common** Anaphylaxis · angioedema · diarrhoea · fever · hypersensitivity reactions · joint pains · rashes · serum sickness-like reaction · urticaria
  - **Rare** Cerebral irritation · CNS toxicity (including convulsions) · coagulation disorders · encephalopathy · haemolytic anaemia · interstitial nephritis · leucopenia · thrombocytopenia
  - **Frequency not known** Antibiotic-associated colitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **CNS toxicity** A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.
  - **Diarrhoea** Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.
- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

**ANTIBACTERIALS** > PENICILINS, ANTIPSEUDOMONAL WITH BETA-LACTAMASE INHIBITOR

**Piperacillin with tazobactam**

- **INDICATIONS AND DOSE**
  - Hospital-acquired pneumonia · Septicaemia · Complicated infections involving the urinary-tract · Complicated infections involving the skin · Complicated infections involving the soft-tissues
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 90 mg/kg every 8 hours.
      - Child 1 month–11 years: 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
      - Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
  - **Complicated intra-abdominal infections**
    - **BY INTRAVENOUS INFUSION**
      - Child 2–11 years: 112.5 mg/kg every 8 hours (max. per dose 4.5 g)
      - Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
  - **Infections in neutropenic patients**
    - **BY INTRAVENOUS INFUSION**
      - Child: 90 mg/kg every 6 hours (max. per dose 4.5 g)

- **UNLICENSED USE** Not licensed for use in children under 12 years (except for children 2–12 years with neutropenia and complicated intra-abdominal infections).
- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations).
- **INTERACTIONS** > Appendix 1: penicillins
- **SIDE-EFFECTS**
  - **Common or very common** Nausea · vomiting
  - **Uncommon** Constipation · dyspepsia · headache · hypotension · injection-site reactions · insomnia · jaundice · stomatitis
  - **Rare** Abdominal pain · eosinophilia · hepatitis
  - **Very rare** Hypoglycaemia · hypokalaemia · pancytopenia · Steven-Johnson syndrome · toxic epidermal necrolysis
  - **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Trace amount in milk, but appropriate to use.
  - **RENAL IMPAIRMENT** Child under 12 years 78.75 mg/kg (max. 4.5 g) every 8 hours if estimated glomerular filtration rate less than 50 mL/minute/1.73 m². Child 12–18 years max. 4.5 g every 8 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; max. 4.5 g every 12 hours if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
Ticarcillin with clavulanic acid

- **INDICATIONS AND DOSE**
  - **Infections due to Pseudomonas and Proteus spp.**
    - **BY INTRAVENOUS INFUSION**
      - Preterm neonate (body-weight up to 2 kg): 80 mg/kg every 12 hours.
      - Preterm neonate (body-weight 2 kg and above): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
      - Neonate: 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
      - Child (body-weight up to 40 kg): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
      - Child (body-weight 40 kg and above): 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections.

- **CAUTIONS**
  - High doses may lead to hypomagnesaemia (owing to sodium content of preparations)
  - **FURTHER INFORMATION**
    - Cholestatic jaundice: Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **INTERACTIONS**
  - Appendix 1: penicillins
  - **SIDE-EFFECTS**
    - Eosinophilia, haemorrhagic cystitis (more frequent in children), hypokalaemia, injection-site reactions, nausea, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting
  - **PREGNANCY**
    - Not known to be harmful.
  - **BREAST FEEDING**
    - Trace amounts in milk, but appropriate to use.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution in severe impairment.
  - **RENAL IMPAIRMENT**
    - Accumulation of electrolytes contained in preparation can occur in patients with renal failure.
      - In neonates: Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
      - In Children: Use normal dose every 8 hours if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use half normal dose every 8 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
  - **EFFECT ON LABORATORY TESTS**
    - False-positive urinary glucose (if tested for reducing substances).
  - **DIRECTIONS FOR ADMINISTRATION**
    - Displacement value may be significant when reconstituting injection, consult local guidelines. For *intravenous infusion*, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

---

**Ticarcillin with clavulanic acid**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

  - **Powder for solution for injection**
    - **ELECTROLYTES:** May contain Sodium
      - Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial (£0.70) 
      - Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 500mg powder for solution for injection vials | 1 vial (£1.20)
      - Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 4 gram Piperacillin 4g / Tazobactam 250mg powder for solution for injection vials | 1 vial (£1.97) (Hospital only)
      - Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials | 1 vial (£1.57) (Hospital only)

---

**Benzylpenicillin sodium**

(Penicillin G)

- **INDICATIONS AND DOSE**
  - **Mild to moderate susceptible infections:** Throat infections, Otitis media, Cellulitis, Pneumonia
    - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.
      - Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.
      - Child: 25 mg/kg every 6 hours; increased if necessary to 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours) in severe infection, intravenous route recommended in infants
Endocarditis (in combination with other antibacterial if necessary)
* BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
* Child: 25 mg/kg every 4 hours; increased if necessary to 50 mg/kg every 4 hours (max. per dose 2.4 g every 4 hours)

Meningitis | Meningococcal disease
* BY INTRAVENOUS INFUSION
* Neonate up to 7 days: 50 mg/kg every 12 hours.
* Neonate 7 days to 28 days: 50 mg/kg every 8 hours.
* Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicemia) prior to urgent transfer to hospital
* BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
* Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
* Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
* Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently
* BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
* Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital
* Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital
* Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital

Neonatal sepsis
* BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INFUSION
* Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.
* Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

**Phenoxyemethylpenicillin**
(Penicillin V)

**INDICATIONS AND DOSE**

**Oral infections | Tonsillitis | Otitis media | Erysipelas | Cellulitis**
* BY MOUTH
  * Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 125 mg/kg 4 times a day
  * Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 125 mg/kg 4 times a day
  * Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 125 mg/kg 4 times a day
  * Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day

**Prevention of recurrence of rheumatic fever**
* BY MOUTH
  * Child 1 month–5 years: 125 mg twice daily
  * Child 6–17 years: 250 mg twice daily

**Prevention of secondary case of invasive group A streptococcal infection**
* BY MOUTH
  * Neonate: 12.5 mg/kg every 6 hours (max. per dose 62.5 mg) for 10 days.
  * Child 1–11 months: 62.5 mg every 6 hours for 10 days
  * Child 1–5 years: 125 mg every 6 hours for 10 days
  * Child 6–11 years: 250 mg every 6 hours for 10 days
  * Child 12–17 years: 500–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**
* BY MOUTH
  * Child 1–11 months: 62.5 mg twice daily
  * Child 1–4 years: 125 mg twice daily
  * Child 5–17 years: 250 mg twice daily

**INTERACTIONS**
* Appendix 1: penicillins

**PREGNANCY**
* Not known to be harmful.

**BREAST FEEDING**
* Trace amounts in milk, but appropriate to use.

**EFFECT ON LABORATORY TESTS**
* False-positive urinary glucose (if tested for reducing substances).

**INTERACTIONS**
* Appendix 1: penicillins

**PREGNANCY**
* Not known to be harmful.

**BREAST FEEDING**
* Trace amounts in milk, but appropriate to use.

**EFFECT ON LABORATORY TESTS**
* False-positive urinary glucose (if tested for reducing substances).

**PATIENT AND CARER ADVICE**
* Medicines for Children leaflet: Penicillin V for bacterial infections www.medicinesforchildren.org.uk/penicillin-v-for-bacterial-infections

**IMPORTANT SAFETY INFORMATION**

Intrathecal injection of benzylpenicillin is not recommended.

**CAUTIONS**
* Accumulation of sodium from injection can occur with high doses

**INTERACTIONS**
* Appendix 1: penicillins

**PREGNANCY**
* Not known to be harmful.

**BREAST FEEDING**
* Trace amounts in milk, but appropriate to use.

**RENAI IMPAIRMENT**
* Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma. Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m², use normal dose every 12 hours.

**EFFECT ON LABORATORY TESTS**
* False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**
* Intravenous route recommended in neonates and infants. For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.

**MEDICINAL FORMS**
* There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for injection**
* **ELECTROLYTES:** May contain Sodium
  * Benzylpenicillin sodium 600 mg
  * Benzylpenicillin sodium 1.2 gram

**BNFC**
* 2017–2018

**BNFC**
* 2017–2018
**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Phenoxymethylpenicillin Tablets may be prescribed.

Phenoxymethylpenicillin Oral Solution may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Oral solution

**CAUTIONARY AND ADVISORY LABELS** 9, 23

- **Phenoxymethylpenicillin (Non-proprietary)**
  - Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium) 25 mg per 1 ml
    - Phenoxymethylpenicillin 250mg/5ml oral solution | 100 ml (PO) £34.00 DT price = £14.73
    - Phenoxymethylpenicillin 125mg/5ml oral solution sugar free sugar-free | 100 ml (PO) £25.00 DT price = £16.02
  - Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium) 50 mg per 1 ml
    - Phenoxymethylpenicillin 250mg/5ml oral solution | 100 ml (PO) £35.00 DT price = £14.66
    - Phenoxymethylpenicillin 250mg/5ml oral solution sugar free sugar-free | 100 ml (PO) £35.00 DT price = £16.02

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 9, 23

- **Phenoxymethylpenicillin (Non-proprietary)**
  - Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium) 250 mg
    - Phenoxymethylpenicillin 250mg tablets | 28 tablet (PO) £5.00 DT price = £1.04

### ANTIBACTERIALS  >  **PENICILLINS, BROAD-SPECTRUM**

#### Amoxicillin

(Amoxycillin)

**INDICATIONS AND DOSE**

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
  - Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary up to 60 mg/kg every 12 hours, increased dose used in severe infection
  - Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection
  - Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Cystic fibrosis (treatment of asymptomatic *Haemophilus influenzae* carriage or mild exacerbation)

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection
  - Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Lyme disease (under expert supervision)

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg 3 times a day) usual duration 2–4 weeks.
  - Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50–100 mg/kg every 12 hours.

Enterococcal endocarditis (in combination with another antibiotic)

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 12 hours.

Group B streptococcal infection

- **BY INTRAVENOUS INFUSION**
  - Neonate 7 days to 28 days: 50 mg/kg every 8 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)
Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease— if cover also needed for Haemophilus influenzae

- **BY MOUTH**
  - Child 1 month-4 years: 125 mg twice daily
  - Child 5-11 years: 250 mg twice daily
  - Child 12-17 years: 500 mg twice daily

_Helicobacter pylori_ eradication in combination with clarithromycin and omeprazole

- **BY MOUTH**
  - Child 1-5 years: 250 mg twice daily
  - Child 6-11 years: 500 mg twice daily
  - Child 12-17 years: 1 g twice daily

_Helicobacter pylori_ eradication in combination with metronidazole and omeprazole

- **BY MOUTH**
  - Child 1-5 years: 125 mg 3 times a day
  - Child 6-11 years: 250 mg 3 times a day
  - Child 12-17 years: 500 mg 3 times a day

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parenteral therapy)
  - **SPECIFIC CAUTIONS**
    - With intravenous use Accumulation of sodium can occur with high parenteral doses

- **INTERACTIONS** → Appendix 1: penicillins

- **SIDE-EFFECTS**
  - Common or very common Nausea · vomiting
  - SIDE-EFFECTS, FURTHER INFORMATION
  - Rash If rash occurs, discontinue treatment
  - PREGNANCY Not known to be harmful
  - BREAST FEEDING Trace amount in milk, but appropriate to use
  - RENAL IMPAIRMENT Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.

- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

- **PROFESSIONAL SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**
  - **ELECTROLYTES**: May contain Sodium
    - Amoxicillin (Non-proprietary)
      - Amoxicillin (as Amoxicillin sodium) 250 mg Amoxicillin 250mg powder for solution for injection vials | 10 vial (Pom) £4.80
      - Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500mg powder for solution for injection vials | 10 vial (Pom) £9.60 DT price = £5.48
      - Amoxicillin (as Amoxicillin sodium) 1 gram Amoxicillin 1g powder for solution for injection vials | 1 vial (Pom) £1.92
    - Amoxil (GlaxoSmithKline UK Ltd)
      - Amoxicillin (as Amoxicillin sodium) 500 mg Amoxil 500mg powder for solution for injection vials | 10 vial (Pom) £5.48 DT price = £5.48
      - Amoxicillin (as Amoxicillin sodium) 1 gram Amoxil 1g powder for solution for injection vials | 10 vial (Pom) £10.96 DT price = £10.96

- **Oral suspension**
  - **CAUTIONARY AND ADVISORY LABELS**
  - **EXCIPIENTS**: May contain Sucrose
    - Amoxicillin (Non-proprietary)
      - Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml Amoxicillin 125mg/5ml oral suspension sugar free sugar-free | 100 ml (Pom) £25.00 DT price = £0.96
      - Amoxicillin 125mg/5ml oral suspension | 100 ml (Pom) £25.00 DT price = £0.96
      - Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml Amoxicillin 250mg/5ml oral suspension sugar free sugar-free | 100 ml (Pom) £35.00 DT price = £1.13
      - Amoxicillin 250mg/5ml oral suspension | 100 ml (Pom) £35.00 DT price = £1.13
    - Amoxil (GlaxoSmithKline UK Ltd)
      - Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 ml Amoxil 125mg/1.25ml paediatric oral suspension | 20 ml (Pom) £3.18 DT price = £3.18

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS**
  - **EXCIPIENTS**: May contain Sucrose
    - Amoxicillin (Non-proprietary)
      - Amoxicillin (as Amoxicillin trihydrate) 3 gram Amoxicillin 3g oral powder sachets sugar free sugar-free | 2 sachet (Pom) £15.00 DT price = £3.98

- **Ampicillin**

  - **INDICATIONS AND DOSE**
  - Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)
    - **BY MOUTH**
      - Neonate 7 days to 20 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
      - Neonate 21 days to 28 days: 30 mg/kg 4 times a day (max. per dose 125 mg).
      - Child 1-11 months: 125 mg 4 times a day.; increased if necessary up to 30 mg/kg 4 times a day
      - Child 1-4 years: 250 mg 4 times a day.; increased if necessary up to 30 mg/kg 4 times a day

    - Amoxil (GlaxoSmithKline UK Ltd)
      - Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 ml Amoxil 125mg/1.25ml paediatric oral suspension | 20 ml (Pom) £3.18 DT price = £3.18

  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS**: May contain Sucrose
      - Amoxicillin (Non-proprietary)
      - Amoxicillin (as Amoxicillin trihydrate) 3 gram Amoxicillin 3g oral powder sachets sugar free sugar-free | 2 sachet (Pom) £15.00 DT price = £3.98

  - **Combinations available: Co-amoxiclav, p. 328**
Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)
Child 12-17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

Neonate 7 days to 20 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

Neonate 21 days to 28 days: 30 mg/kg every 6 hours, increased if necessary to 60 mg/kg every 6 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

Child: 25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours), increased if necessary to 50 mg/kg every 6 hours (max. per dose 1 g every 6 hours), increased dose used in severe infection

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibacterial)

BY INTRAVENOUS INFUSION

Neonate up to 7 days: 50 mg/kg every 12 hours.

Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

Neonate 21 days to 28 days: 50 mg/kg every 6 hours.

Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Listerial meningitis

BY INTRAVENOUS INFUSION

Neonate up to 7 days: 100 mg/kg every 12 hours.

Neonate 7 days to 20 days: 100 mg/kg every 8 hours.

Neonate 21 days to 28 days: 100 mg/kg every 6 hours.

Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) • chronic lymphocytic leukaemia (increased risk of erythematous rash) • cytomegalovirus infection (increased risk of erythematous rash) • glandular fever (erythematous rash common)

SPECIFIC CAUTIONS

With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

INTERACTIONS ➔ Appendix 1: penicillins

SIDE-EFFECTS

Common or very common Nausea • vomiting

SIDE-EFFECTS. FURTHER INFORMATION

Rash If rash occurs, discontinue treatment.

PREGNANCY Not known to be harmful.

BREAST FEEDING Trace amounts in milk, but appropriate to use.

RENAL IMPAIRMENT If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

DIRECTIONS FOR ADMINISTRATION

With oral use Administer at least 30 minutes before food.

With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ampicillin for bacterial infection

www.medicinesforchildren.org.uk/ampicillin-bacterial-infection

MEDITINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 23

Ampicillin (Non-proprietary)

Ampicillin 25 mg per 1 ml Ampicillin 125mg/5ml oral suspension | 100 ml (PoM) £25.86 DT price = £29.86

Ampicillin 50 mg per 1 ml Ampicillin 250mg/5ml oral suspension | 100 ml (PoM) £38.86 DT price = £38.86

Powder for solution for injection

Ampicillin (Non-proprietary)

Ampicillin (as Ampicillin sodium) 500 mg Ampicillin 500mg powder for solution for injection vials | 10 vial (PoM) £78.30 DT price = £78.30

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 23

Ampicillin (Non-proprietary)

Ampicillin 250 mg Ampicillin 250mg capsules | 28 capsule (PoM) £20.50 DT price = £20.50

Ampicillin 500 mg Ampicillin 500mg capsules | 28 capsule (PoM) £40.30 DT price = £40.30

Co-fluampicil

INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

BY MOUTH

Child 1 month–9 years: 125/125 mg every 6 hours

Child 10–17 years: 250/250 mg every 6 hours

BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child 1 month–1 year: 62.5/62.5 mg every 6 hours

Child 2–9 years: 125/125 mg every 6 hours

Child 10–17 years: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

BY MOUTH

Child 1 month–9 years: 250/250 mg every 6 hours

Child 10–17 years: 500/500 mg every 6 hours

BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child 1 month–1 year: 125/125 mg every 6 hours

Child 2–9 years: 250/250 mg every 6 hours

Child 10–17 years: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

• Flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
• flucloxacinil should be used with caution in patients with hepatic impairment;
• careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

CAUTIONS

GENERAL CAUTIONS
Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS
• With intravenous use. Accumulation of electrolytes contained in parenteral preparations can occur with high doses - risk of kernicterus in jaundiced neonates when high doses given parenterally

INTERACTIONS ➔ Appendix 1: penicillins

SIDE-EFFECTS
• Common or very common Gastro-intestinal disturbances - nausea - vomiting
• Very rare Cholestatic jaundice - hepatitis

SIDE-EFFECTS, FURTHER INFORMATION
• Rash If rash occurs, discontinue treatment.
• PREGNANCY Not known to be harmful.
• BREAST FEEDING Trace amount in milk, but appropriate to use.
• HEPATIC IMPAIRMENT Use with caution.
• RENAL IMPAIRMENT Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

EFFECT ON LABORATORY TESTS False-positive urinary glucose (if tested for reducing substances).

PRESCRIBING AND DISPENSING INFORMATION
Dose expressed as a combination of equal parts by mass of flucloxacinil and ampicillin.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 22
• Co-fluampicil (Non-proprietary)
  Ampicillin (as Ampicillin trihydrate) 25 mg per 1 mL, Flucloxacillin (as Flucloxacillin magnesium) 25 mg per 1 mL Co-fluampicil 125mg/125mg/5ml oral suspension | 100 ml (POM) £23.93 DT price = £23.93

Powder for solution for injection

ELECTROLYTES: May contain Sodium
• Co-fluampicil (Non-proprietary)
  Ampicillin (as Ampicillin sodium) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg Co-fluampicil 250mg/250mg powder for solution for injection vials | 10 vial (POM) £13.33

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 22
• Co-fluampicil (Non-proprietary)
  Ampicillin (as Ampicillin trihydrate) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg Co-fluampicil 250mg/250mg capsules | 28 capsule (POM) £10.31 DT price = £2.18 | 100 capsule (POM) £7.79-£42.99

ANTIBACTERIALS ➔ PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR

Co-amoxiclav

INDICATIONS AND DOSE
Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

BY MOUTH USING TABLETS
• Child 1-2 months: 30 mg/kg every 12 hours
• Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)

BY MOUTH USING ORAL SUSPENSION
• Child 1-2 months: 0.25 mL/kilogram 3 times a day.
• Child 1-5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)

BY MOUTH USING ORAL SUSPENSION
• Child 2 months-1 year: 0.15 mL/kilogram twice daily, doubled in severe infection
• Child 2-6 years (body-weight 13-21 kg): 2.5 mL twice daily, doubled in severe infection
• Child 7-12 years (body-weight 22-40 kg): 5 mL twice daily, doubled in severe infection
• Child 12-17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

BY MOUTH USING TABLETS
• Child 12-17 years: 250/125 mg every 8 hours for 5 days

DOSE EQUIVALENCE AND CONVERSION
• Doses are expressed as co-amoxiclav.
• A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.
**CONTRA-INDICATIONS**  History of co-amoxiclav-associated jaundice or hepatic dysfunction  -  history of penicillin-associated jaundice or hepatic dysfunction

**CAUTIONS**

**GENERAL CAUTIONS**
- Acute lymphocytic leukaemia (increased risk of erythematous rashes)  -  chronic lymphocytic leukaemia (increased risk of erythematous rashes)  -  cytomegalovirus infection (increased risk of erythematous rashes)  -  glandular fever (erythematous rashes common)  -  maintain adequate hydration with high doses (particularly during parental therapy)

**SPECIFIC CAUTIONS**
- With intravenous use: Accumulation of electrolytes contained in parenteral preparations can occur with high doses.
- Cholestatic jaundice: Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common**  Cholestatic jaundice  -  hepatitis  -  nausea  -  vomiting
- **Rare**  Dizziness  -  headache  -  prolongation of bleeding time
- **Frequency not known**  Exfoliative dermatitis  -  Steven-Johnson syndrome  -  toxic epidermal necrolysis  -  vasculitis

**SPECIFIC SIDE-EFFECTS**
- **Rare**  -  With intravenous use: Phlebitis at injection site
- **With oral use:**  Superficial staining of teeth with suspension

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Rash**  If rash occurs, discontinue treatment.

**PREGNANCY**  Not known to be harmful.

**BREAST FEEDING**  Trace amount in milk, but appropriate to use.

**HEPATIC IMPAIRMENT**  Monitor liver function in liver disease.

**RENAL IMPAIRMENT**
- With oral use:  *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets:*  use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

*Co-amoxiclav 400/57 suspension:*  avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- With intravenous use:  *Co-amoxiclav injection:*  use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Risk of crystalluria with high doses (particularly during parenteral therapy).

Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**  For *intravenous infusion,* dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For *intravenous injection,* administer over 3–4 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

Flavours of oral liquid formulations may include raspberry and orange.

**PATIENT AND CARER ADVICE**

**With oral use:** 70 70 100 100 70

**SIDE-EFFECTS, FURTHER INFORMATION**

**SPECIFIC SIDE-EFFECTS**

**JAUNDICE OR HEPATIC DYSFUNCTION**
- Risk of crystalluria with high doses (particularly during parenteral therapy).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

**9 EXCIPIENTS:**  May contain Aspartame

* Co-amoxiclav (Non-proprietary)
  -  Clavulanic acid (as Potassium clavulanate) 6.25 mg per 1 ml, Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml  Co-amoxiclav 125mg/31mg/5ml oral suspension  | 100 ml  (PO) £5.00 DT price + £5.00

Pivmecillinam hydrochloride

**INDICATIONS AND DOSE**

**Acute uncomplicated cystitis**
- **BY MOUTH**
  - Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

**Chronic or recurrent bacteriuria**
- **BY MOUTH**
  - Child (body-weight 40 kg and above): 400 mg every 6–8 hours

**Urinary-tract infections**
- **BY MOUTH**
  - Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

**UNLICENSED USE** Not licensed for use in children under 3 months.

**CONTRA-INDICATIONS** Carnitine deficiency • gastrointestinal obstruction • infants under 3 months • oesophageal strictures

**CAUTIONS** Avoid in acute porphyrias p. 577

**INTERACTIONS** → Appendix 1: penicillins

**SIDE-EFFECTS**
- Common or very common Abdominal pain • dizziness • headache • nausea • vomiting
- Frequency not known Mouth ulcers • oesophagitis • reduced serum and total body carnitine (especially with long-term or repeated use)

**PREGNANCY** Not known to be harmful, but manufacturer advises avoid.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

**PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

**ANTIBACTERIALS > PENICILLINS, MECILLINAM-TYPE**

**Flucloxacillin**

**INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis
- **BY MOUTH**
  - Neonate up to 7 days: 25 mg/kg twice daily.
  - Neonate 7 days to 20 days: 25 mg/kg 3 times a day.
  - Neonate 21 days to 28 days: 25 mg/kg 4 times a day.
  - Child 1 month–1 year: 62.5–125 mg 4 times a day
  - Child 2–9 years: 125–250 mg 4 times a day
  - Child 10–17 years: 250–500 mg 4 times a day
  - **BY INTRAMUSCULAR INJECTION**
    - Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)
  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Neonate up to 7 days: 25 mg/kg every 12 hours.
    - Neonate 7 days to 20 days: 25 mg/kg every 8 hours.
    - Neonate 21 days to 28 days: 25 mg/kg every 6 hours.
    - Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Severe infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia (severe infection) | Adjunct in impetigo (severe infection) | Adjunct in cellulitis (severe infection)
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
  - Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Endocarditis (in combination with other antibacterial if necessary)
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50–100 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
  - Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 9, 21, 27
  - **Selexid (LEO Pharma)**
    - Pivmecillinam hydrochloride 200 mg Selexid 200mg tablets | 10 tablet [Po][8] £5.40 DT price = £5.40 | 18 tablet [Po][8] £9.72

**CONTRA-INDICATIONS**

- Avoid in acute porphyrias p. 577
- Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).
Cerebral abscess | Staphylococcal meningitis
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 50–100 mg/kg every 12 hours.

- Neonate 7 days to 20 days: 33 mg/kg every 6 hours.

- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours).

Staphylococcal lung infection in cystic fibrosis
- BY MOUTH
- Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day.

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours).

Prevention of Staphylococcus aureus lung infection in cystic fibrosis—primary prevention
- BY MOUTH
- Neonate: 125 mg twice daily.

- Child 1 month–3 years: 125 mg twice daily

Prevention of Staphylococcus aureus lung infection in cystic fibrosis—secondary prevention
- BY MOUTH
- Child: 50 mg/kg twice daily (max. per dose 1 g twice daily).

**IMPORTANT SAFETY INFORMATION**

**HEPATIC IMPAIRMENT**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

**SIDE-EFFECTS**

- With intravenous use: Accumulation of electrolytes can occur with high doses - risk of karnicterus in jaundiced neonates when high doses given parenterally

**INTERACTIONS**

- Appendix 1: penicillins

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT**

Use with caution.

**RENAL IMPAIRMENT**

Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 ml/minute/1.73 m².

- With intravenous use: Accumulation of electrolytes can occur in patients with renal failure.

**EFFECT ON LABORATORY TESTS**

False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion, dilute reconstituted solution in Glucose 5% or Sodium Chloride 0.9% and give intermittently over 30–60 minutes.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Flucloxacillin for bacterial infections

- Flucloxacillin (Non-proprietary)

  - Flucloxacillin (as Flucloxacillin sodium) 25 mg per 1 ml: Flucloxacillin 125 mg/5 ml oral solution | 100 ml (POM) £0.99 DT price = £6.58
  - Flucloxacillin 125 mg/5 ml oral solution sugar free sugar-free | 100 ml (POM) £1.41 DT price = £22.31

- Flucloxacillin (as Flucloxacillin sodium) 50 mg per 1 ml: Flucloxacillin 250 mg/5 ml oral solution sugar free sugar-free | 100 ml (POM) £3.27 DT price = £26.91

  - Flucloxacillin 250 mg/5 ml oral solution | 100 ml (POM) £26.04 DT price = £26.04

**Powder for solution for injection**

- Flucloxacillin (Non-proprietary)

  - Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250 mg powder for solution for injection vials | 10 vial (POM) £10.43–£12.25

  - Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500 mg powder for solution for injection vials | 10 vial (POM) £20.85–£24.50

  - Flucloxacillin (as Flucloxacillin sodium) 1 gram Flucloxacillin 1g powder for solution for injection vials | 10 vial (POM) £41.75–£49.00

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 19, 23

- Flucloxacillin (Non-proprietary)

  - Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250 mg capsules | 20 capsule (POM) £3.58 | 28 capsule (POM) £5.00 DT price = £1.31 | 100 capsule (POM) £17.80

  - Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500 mg capsules | 20 capsule (POM) £7.50 | 28 capsule (POM) £10.50 DT price = £2.17 | 100 capsule (POM) £37.50

**Combinations available:** Co-fluampicil, p. 327

**ANTIBACTERIALS**

- Polymyxins

**Colistimethate sodium**

(Colistin sulfoxomethate sodium)

- **DRUG ACTION**

  The polymyxin antibiotic, colistimethate sodium (colistin sulfoxomethate sodium), is active against Gram-negative organisms including Pseudomonas aeruginosa, Acinetobacter baumannii, and Klebsiella pneumoniae. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

- **INDICATIONS AND DOSE**

  Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae*

  - BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

  - Child (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

  - Child (body-weight 60 kg and above): 1–2 million units 3 times a day, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day
Adjuvant to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis

- **By inhalation of nebulised solution**
  - Child 1 month - 1 year: 0.5 – 1 million units twice daily, adjusted according to response, increased to 1 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
  - Child 2 - 17 years: 1 – 2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
- **By inhalation of powder**
  - Child 6–12 years: 1.66 million units twice daily

**Promixin® injection**

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa, Acinetobacter baumannii, Klebsiella pneumoniae*

- **By slow intravenous injection, or by intravenous infusion**
  - Child (body weight up to 40 kg): 75 000 – 150 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
  - Child (body weight 40 kg and above): 9 million units daily in 2 – 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

**Promixin® nebuliser solution**

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* patients with cystic fibrosis

- **By inhalation of nebulised solution**
  - Child 1 month - 1 year: 0.5 – 1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
  - Child 2 - 17 years: 1 – 2 million units 2 – 3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

- **Contra-indications** Myasthenia gravis
- **Cautions**
  - General cautions
    - Acute porphyrias p. 577
  - Specific cautions
    - When used by inhalation Severe haemoptysis—risk of further haemorrhage
  - **Interactions** Appendix 1: colistimethate
- **Side-effects**
  - Common or very common
    - When used by inhalation Bronchospasm · cough · dysphonia · nausea · sore mouth · sore throat · taste disturbances · vomiting
  - Uncommon
    - When used by inhalation Hypersalivation · thirst
  - Rare
    - With intravenous use Vasomotor instability
    - Frequency not known
      - With intravenous use Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances
- **Side-effects, further information**
  - Dose-related side-effects The major adverse effects are dose-related neurotoxicity and nephrotoxicity.
- **Pregnancy**
  - When used by inhalation Clinical use suggests probably safe.

- With intravenous use Use only if potential benefit outweighs risk.
- **Breast feeding** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).
- **Renal impairment**
  - With intravenous use Reduce dose. Monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5 – 15 mg/litre; pre-dose (‘trough’) concentration 2 – 6 mg/litre.
- **Monitoring requirements**
  - With intravenous use Monitor renal function.
  - When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

- **Directions for administration**
  - When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For *nebulisation* administer required dose in 2 – 4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
  - With intravenous use For *intravenous infusion*, dilute to a concentration of 40 000 units/mL with Sodium Chloride 0.9%; give over 30 minutes. For *slow intravenous injection* into a totally implantable venous access device, dilute to a concentration of 90 000 units/mL with Sodium Chloride 0.9% for child under 12 years (200 000 units/mL for child over 12 years).

- **Colomycin** Colomycin® Injection may be used for nebulisation; administer required dose in 2 – 4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

- **Prescribing and dispensing information**
  - Colistimethate sodium is included in some preparations for topical application.

- **Patient and carer advice**
  - Driving and skilled tasks
    - Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.
  - When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

- **National funding/access decisions**

  NICE technology appraisals (TAs)

  - Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
  - Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.
  - [www.nice.org.uk/TA276](http://www.nice.org.uk/TA276)
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Electrolytes:** May contain Sodium
- **Colistimethate sodium (Non-proprietary)**
  - Colistimethate sodium 1000000 unit: Colistimethate 1 million unit powder for solution for injection vials | 10 vial (FMD) £16.75 | 10 vial (FMD) £16.79 (Hospital only)
- **Colomycin (Teva UK Ltd)**
  - Colistimethate sodium 1000000 unit: Colomycin 1 million unit powder for solution for injection vials | 10 vial (FMD) £18.00
- **Colistimethate sodium 2000000 unit**
  - Colistimethate 2 million unit powder for solution for injection vials | 10 vial (FMD) £32.40
- **Promixin (Profile Pharma Ltd)**

  - Colistimethate 2 MIU powder for nebuliser solution unit dose vials | 56 unit dose (FMD) £261.72
- **Promixin (Profile Pharma Ltd)**
  - Colistimethate sodium 1000000 unit: Promixin 1 million unit powder for nebuliser solution unit dose vials | 30 unit dose (FMD) £160.00 DT price | £168.00

**ANTIBACTERIALS > QUINOLONES**

**Quinolones**

**Overview**
Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin is licensed in children over 1 year of age for pseudomonal infections in cystic fibrosis, for complicated urinary-tract infections, and for treatment and prophylaxis of inhalation anthrax. When the benefits of treatment outweigh the risks, ciprofloxacin is licensed in children over 1 year of age for severe infections of the respiratory tract and of the gastrointestinal system (including typhoid fever). It is also used in the treatment of septicaemia caused by multi-resistant organisms (usually hospital acquired) and gonorrhoea (although resistance is increasing). Ciprofloxacin is also used in the prophylaxis of meningococcal disease.

Nalidixic acid p. 335 may be used in uncomplicated urinary-tract infections that are resistant to other antibiotics in children over 3 months of age.

Many staphylococci are resistant to quinolones and their use should be avoided in MRSA infections.

Ofloxacin eye drops p. 648 are used in ophthalmic infections.

There is much less experience of the other quinolones in children; expert advice should be sought.

**IMPORTANT SAFETY INFORMATION**
The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

**TENDON DAMAGE**
Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:
- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**CONTRA-INDICATIONS**
- History of tendon disorders related to quinolone use

**CAUTIONS**
- Can prolong the QT interval - children or adolescents (arthropathy has developed in weight-bearing joints in young animals); conditions that predispose to seizures - diabetes (may affect blood glucose) - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) - G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation)

**CAUTIONS, FURTHER INFORMATION**
Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

**SIDE-EFFECTS**
- **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting
- **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor
- **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dysphoena · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis
- **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**
The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

**ALLERGY AND CROSS-SENSITIVITY**
- Use of quinolones contra-indicated in quinolone hypersensitivity.

**PREGNANCY**
- Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

_Ciprofloxacin_

**INDICATIONS AND DOSE**

**Fistulating Crohn’s disease**
- **BY MOUTH**
  - Child: 5 mg/kg twice daily

**Severe respiratory-tract infections, gastro-intestinal infection**
- **BY MOUTH**
  - Neonate: 15 mg/kg twice daily.
  - Child: 20 mg/kg twice daily (max. per dose 750 mg)
334 Bacterial infection

BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 12 hours, to be given over 60 minutes.
- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes.

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- BY MOUTH
- Child: 20 mg/kg twice daily (max. per dose 750 mg)
- BY INTRAVENOUS INFUSION
- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes.

Complicated urinary-tract infections

- BY MOUTH
- Neonate: 10 mg/kg twice daily.
- Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)
- BY INTRAVENOUS INFUSION
- Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.
- Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection.

Gonorrhoea

- BY MOUTH
- Child 12-17 years: 500 mg for 1 dose.

Anthrax (treatment and post-exposure prophylaxis)

- BY MOUTH
- Child: 15 mg/kg twice daily (max. per dose 500 mg)
- BY INTRAVENOUS INFUSION
- Child: 10 mg/kg every 12 hours (max. per dose 400 mg)

Prevention of secondary case of meningococcal meningitis

- BY MOUTH
- Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.
- Child 1 month-4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose.
- Child 5-11 years: 250 mg for 1 dose.
- Child 12-17 years: 500 mg for 1 dose.

UNLICENSED USE

CAUTIONS

Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - ensure adequate fluid intake (risk of crystalluria) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation).

INTERACTIONS → Appendix 1: quinolones

SIDE-EFFECTS

- Common or very common: Flatulence
- With intravenous use: Pain at injection site - phlebitis at injection site.
- Rare: Abnormal dreams - chest pain - dysphagia - dyspnoea - erythema nodosum - hot flushes - hyperglycaemia.

hypoglycaemia - oedema - pancreatitis - sweating - syncope - tachycardia.

Frequency not known: Peripheral neuropathy - polynuropathy.

PREGNANCY

A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

BREAST FEEDING

Amount too small to be harmful but manufacturer advises avoid.

RENAL IMPAIRMENT

Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² - consult product literature.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include strawberry.

PATIENT AND CARER ADVICE

Driving and skilled tasks

May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin hydrochloride) 100 mg Ciprofloxacin 100mg tablets | 6 tablet (POT) £4.50 DT price = £1.90

Ciprofloxacin (as Ciprofloxacin hydrochloride) 250 mg Ciprofloxacin 250mg tablets | 10 tablet (POT) £7.25 DT price + £0.75 | 20 tablet (POT) £11.50 | 100 tablet (POT) no price available

Ciprofloxacin (as Ciprofloxacin hydrochloride) 500 mg Ciprofloxacin 500mg tablets | 10 tablet (POT) £14.00 DT price + £0.89 | 20 tablet (POT) £21.23 | 100 tablet (POT) no price available

Ciprofloxacin (as Ciprofloxacin hydrochloride) 750 mg Ciprofloxacin 750mg tablets | 10 tablet (POT) £20.00 DT price + £8.00 | 20 tablet (POT) £40.00 no price available

Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin hydrochloride) 250 mg Ciproxin 250mg tablets | 10 tablet (POT) £6.59 DT price = £0.75

Ciprofloxacin (as Ciprofloxacin hydrochloride) 500 mg Ciproxin 500mg tablets | 10 tablet (POT) £12.49 DT price = £0.89

Ciprofloxacin (as Ciprofloxacin hydrochloride) 750 mg Ciproxin 750mg tablets | 10 tablet (POT) £17.78 DT price = £8.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

Ciproxin (Bayer Plc)

Ciprofloxacin 50 mg per 1 ml Ciproxin 250mg/5ml oral suspension | 100 ml (POT) £21.29 DT price = £21.29

Solution for infusion

ELECTROLYTES: May contain Sodium

Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per 1 ml Ciprofloxacin 400mg/200ml solution for infusion bottles | 5 bottle (POT) £19.59

Ciprofloxacin 400mg/200ml solution for infusion vials | 1 vial (POT) £15.78 (Hospital only)

Ciprofloxacin 200mg/100ml solution for infusion bottles | 10 bottle (POT) £14.45

Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per 1 ml Ciproxin Infusion 100mg/50ml solution for infusion bottles | 1 bottle (POT) £7.61 (Hospital only)

Ciproxin Infusion 400mg/200ml solution for infusion bottles | 5 bottle (POT) £114.23 (Hospital only)

Ciproxin Infusion 200mg/100ml solution for infusion bottles | 5 bottle (POT) £75.06 (Hospital only)
Infusion
- Ciprofloxacin (Non-proprietary) Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per 1 ml Ciprofloxacin 400mg/200ml infusion bags | 10 bag £200.00

Nalidixic acid

INDICATIONS AND DOSE
Treatment of urinary tract infection resistant to other antibiotics
- BY MOUTH
  - Child 3 months-11 years: 12.5 mg/kg 4 times a day for 7 days, then reduced to 7.5 mg/kg 4 times a day for prolonged therapy in chronic infections
  - Child 12-17 years: 900 mg 4 times a day for 7 days, then reduced to 600 mg 4 times a day for prolonged therapy in chronic infections

Prophylaxis of urinary tract infections resistant to other antibiotics
- BY MOUTH
  - Child 3 months-11 years: 15 mg/kg twice daily

CAUTIONS
- Acute myocardial infarction (risk factor for QT interval prolongation) • avoid in acute porphyrias p. 577 • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • electrolyte disturbances (risk factor for QT interval prolongation) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS
- Appendix 1: quinolones

SIDE-EFFECTS
- Cranial nerve palsy • increased intracranial pressure • metabolic acidosis • peripheral neuropathy • toxic psychosis

BREAST FEEDING
- Risk to infant very small but one case of haemolytic anaemia reported.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in liver disease.

RENAL IMPAIRMENT
- Use with caution; avoid if estimated glomerular filtration rate less than 20 ml/minute/1.73 m².

MONITORING REQUIREMENTS
- Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

EFFECT ON LABORATORY TESTS
- False positive urinary glucose (if tested for reducing substances).

PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include raspberry and strawberry.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

ANTIBACTERIALS > SULFONAMIDES

Co-trimoxazole

DRUG ACTION
Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

INDICATIONS AND DOSE
Treatment of susceptible infections
- BY MOUTH
  - Child 6 weeks-5 months: 120 mg twice daily, (alternatively 24 mg/kg twice daily
  - Child 6 months-5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
  - Child 6-11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
  - Child 12-17 years: 960 mg twice daily
- BY INTRAVENOUS INFUSION
  - Child 6 weeks-17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

Treatment of Pneumocystis jirovecii (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)
- BY MOUTH, OR BY INTRAVENOUS INFUSION
  - Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections
- BY MOUTH
  - Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION
- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

UNLICENSED USE

IMPORTANT SAFETY INFORMATION
RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE
Co-trimoxazole is the drug of choice in the prophylaxis and treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia; it is also indicated for nocardiosis, Stenotrophomonas maltophilia infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by Burkholderia cepacia in cystic fibrosis [unlicensed indication].

CONTRA-INDICATIONS
- Acute porphyrias p. 577

CAUTIONS
- Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency
Sulfadiazine
(Sulphadiazine)

**DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

**INDICATIONS AND DOSE**

**Toxoplasmosis in pregnancy (in combination with pyrimethamine and folic acid)**
- **BY MOUTH**
- Child 12-17 years: 1 g 3 times a day until delivery
- Congenital toxoplasmosis (in combination with pyrimethamine and folic acid)
  - **BY MOUTH**
  - Neonate: 50 mg/kg twice daily for 12 months.

**UNLICENSED USE** Not licensed for use in toxoplasmosis.

**CONTRA-INDICATIONS** Acute porphyrias p. 577

**CAUTIONS** Asthma; avoid in blood disorders (unless under specialist supervision); avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus. G6PD deficiency (risk of haemolytic anaemia); maintain adequate fluid intake; predisposition to folate deficiency

**INTERACTIONS** Appendix 1: sulfamethoxazole, trimethoprim

**SIDE-EFFECTS**
- Common or very common Diarrhoea · headache · hyperkalaemia · nausea · rash
- Uncommon Vomiting
- Rare Agranulocytosis · bone marrow depression
- **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · severe renal impairment; seek expert advice.

**INTERACTIONS**

**SIDE-EFFECTS**
- Common or very common Diarrhoea · headache · hyperkalaemia · nausea · rash
- Uncommon Vomiting

- Uncommon Vomiting
- Rare Agranulocytosis · bone marrow depression
- **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · severe renal impairment; seek expert advice.
leucopenia • liver damage • megaloblastic anaemia • myalgia • myocarditis • pancreatitis • peripheral neuropathy • photosensitivity • pulmonary infiltrates • renal disorders • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo

**Frequency not known** Benign intracranial hypertension • hypothyroidism • optic neuropathy • rhabdomyolysis reported in HIV-infected patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

**PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

**BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.

**MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 9, 27
  - Sulfadiazine (Non-proprietary)
    - Sulfadiazine 500 mg
    - Sulfadiazine 500mg tablets
    - 56 tablet £139.62 DT price + £114.27

**ANTIBACTERIALS**

**Tetracyclines**

**Overview**

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 388), brochopneumonia in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in leprosy also used in respiratory and genital mycoplasma infections, and has been used for meningococcal infections. Tetracyclines are contraindicated in pregnancy and breastfeeding. They are usually bacteriostatic and may be bactericidal in children. They are effective in treating a wide range of infections, including respiratory, gastrointestinal, skin, bone, and urinary tract infections. They are also effective in treating acne, periodontal disease, and infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella, and Leptospira. They are also effective in treating infections caused by Neisseria meningitidis and Haemophilus influenzae, and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 316).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 339 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections.

**Tetracyclines**

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) • systemic lupus erythematosus (may be exacerbated)

**SIDE-EFFECTS**

- Rare Anaphylaxis • angioedema • blood disorders • exfoliative dermatitis • hepatotoxicity • hypersensitivity reactions • pancreatitis • pericarditis • photosensitivity (particularly with demeclocycline) • rash • Stevens-Johnson syndrome • uveitis

- Frequency not known Antibiotic-associated colitis • benign intracranial hypertension • bulging fontanelles (in infants) • diarrhoea • dysphagia • headache • nausea • oesophageal irritation • visual disturbances • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).

- **PREGNANCY** Should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

- **BREAST FEEDING** Should not be given to women who are breastfeeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

**Demeclocycline hydrochloride**

- **INDICATIONS AND DOSE**
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
  - By mouth
  - Child 12-17 years: 150 mg 4 times a day, alternatively 300 mg twice daily

- **CAUTIONS**
  - Photosensitivity more common than with other tetracyclines

- **INTERACTIONS**
  - Appendix 1: tetracyclines

- **SIDE-EFFECTS**
  - Acute renal failure • reversible nephrogenic diabetes insipidus

- **HEPATIC IMPAIRMENT**
  - Max. 1 g daily in divided doses.

- **RENAL IMPAIRMENT**
  - May exacerbate renal failure and should not be given to patients with renal impairment.

- **PATIENT AND CARER ADVICE**
  - Patients should be advised to avoid exposure to sunlight or sun lamps.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - Demeclocycline hydrochloride (Non-proprietary)
    - Demeclocycline hydrochloride 150 mg
    - Demeclocycline hydrochloride 150mg tablets
    - 100 tablet £79.84 DT price + £12.61

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 24
  - Demeclocycline hydrochloride (Non-proprietary)
    - Demeclocycline hydrochloride 150 mg
    - Demeclocycline hydrochloride 150mg capsules
    - 28 capsule £160.89 DT price + £160.89
**Doxycycline**

- **INDICATIONS AND DOSE**
  - **Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: Initially 200 mg daily for 1 dose, then maintain 100 mg once daily
  - **Severe infections (including refractory urinary-tract infections)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 200 mg daily
  - **Acne**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg once daily
  - **Early syphilis**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg twice daily for 14 days
  - **Late latent syphilis**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg twice daily for 28 days
  - **Uncomplicated genital chlamydia | Non-gonococcal urethritis**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg twice daily for 7 days
  - **Pelvic inflammatory disease**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg twice daily for 14 days
  - **Lyme disease (under expert supervision)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
  - **Anthrax (treatment or post-exposure prophylaxis)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 1 month–11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
      - Child 12-17 years: 100 mg twice daily
  - **Prophylaxis of malaria**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
  - **Adjunct to quinine in treatment of Plasmodium falciparum malaria**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 200 mg daily for 7 days
  - **Periodontitis (as an adjunct to gingival scaling and root planing)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12-17 years: 20 mg twice daily for 3 months

- **UNLICENSED USE**

- **CAUTIONS**
  - Alcohol dependence

- **INTERACTIONS**
  - Appendix 1: tetracyclines

- **SIDE-EFFECTS**
  - Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus

- **PREGNANCY**
  - When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.

- **RENAL IMPAIRMENT**
  - Use with caution (avoid excessive doses).

- **MONITORING REQUIREMENTS**
  - When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

- **DIRECTIONS FOR ADMINISTRATION**
  - Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

- **PATIENT AND CARER ADVICE**
  - Counselling on administration advised (posture). Photosensitivity. Patients should be advised to avoid exposure to sunlight or sun lamps.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulation
  - Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 6, 11, 27
  - **Periostat** (Alliance Pharmaceuticals Ltd)
    - Doxycycline (as Doxycycline hyclate) 20 mg | $6 tablet [POM] $17.30 DT price = $17.30
  - **Dispersible tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 13
    - **Vibramycin-D** (Pfizer Ltd)
      - Doxycycline (as Doxycycline monohydrate) 100 mg | $100mg dispersible tablets sugar-free | 8 tablet [POM] $4.91 DT price = $4.91
    - **Capsule**
      - **CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 27
      - **Doxycycline (Non-proprietary)**
        - Doxycycline (as Doxycycline hyclate) 50 mg | Doxycycline 50mg capsules | 28 capsule [POM] $2.26 DT price = $1.29
        - Doxycycline (as Doxycycline hyclate) 100 mg | Doxycycline 100mg capsules | 8 capsule [POM] $1.44 DT price = $0.87 | 50 capsule [POM] $5.44

**Lymecycline**

- **INDICATIONS AND DOSE**
  - **Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**
    - **BY MOUTH**
      - Child 12-17 years: 408 mg twice daily, increased to 1,224–1,632 g daily, (in severe infection)
  - **Acne**
    - **BY MOUTH**
      - Child 12-17 years: 408 mg daily for at least 8 weeks

- **INTERACTIONS**
  - Appendix 1: tetracyclines

- **RENAL IMPAIRMENT**
  - May exacerbate renal failure and should not be given to patients with renal impairment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 6, 9
    - **Lymecycline (Non-proprietary)**
      - Lymecycline 408 mg | Lymecycline 408mg capsules | 28 capsule [POM] $6.95 DT price = $5.14 | 56 capsule [POM] $11.66
    - **Tetralysal** (Gaidlera (UK) Ltd)
      - Lymecycline 408 mg | Tetralysal 300 capsules | 28 capsule [POM] $6.95 DT price = $5.14 | 56 capsule [POM] $11.53
**Minocycline**

**INDICATIONS AND DOSE**

**Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily

**Acne**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg daily

**CAUTIONS** Systemic lupus erythematosus

**SIDE-EFFECTS**

- Rare: Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
- Very rare: Discoloration of conjunctiva · discolouration of sweat · discolouration of tears · systemic lupus erythematosus
- Frequency not known: Dizziness (more common in women) · vertigo (more common in women)

**RENAI IMPAIRMENT** Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

**DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

**PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

| **Minocycline (Non-proprietary)** | **Minocycline (as Minocycline hydrochloride) 50 mg** | **Minocycline 50mg tablets** | 28 tablet | **£8.50 DT price = £5.19** |

**Modified-release capsule**

| **Minocycline (Non-proprietary)** | **Minocycline (as Minocycline hydrochloride) 100 mg** | **Minocycline 100mg modified-release capsules** | 56 capsule | **£24.75 DT price = £20.08** |
| Acmamin MR (Dexcel-Pharma Ltd) | **Acmamin MR (as Minocycline hydrochloride 100 mg)** | 100mg capsules | 56 capsule | **£21.14 DT price = £20.08** |
| Minocin MR (Meda Pharmaceuticals Ltd) | **Minocin MR (as Minocycline hydrochloride 100 mg)** | 100mg capsules | 56 capsule | **£20.08 DT price = £20.08** |

**Capsule**

| **Minocycline (Non-proprietary)** | **Minocycline (as Minocycline hydrochloride) 50 mg** | **Minocycline 50 capsules** | 56 capsule | **£15.27 DT price = £15.27** |
| Minocycline (as Minocycline hydrochloride) 100 mg | **Minocycline 100 capsules** | 56 capsule | **£13.09 DT price = £13.09** |

**Interactions** 

- Appendix 1: tetracyclines

**Renal Impairment**

- May exacerbate renal failure and should not be given to patients with renal impairment.

**Profession Specific Information**

Dental practitioners’ formulary. Tetracycline Tablets may be prescribed.

---

**Oxytetracycline**

**INDICATIONS AND DOSE**

**Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**

- **BY MOUTH**
  - Child 12-17 years: 250–500 mg 4 times a day

**Acne**

- **BY MOUTH**
  - Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

**INTERACTIONS** 

- Appendix 1: tetracyclines

**Renal Impairment**

- May exacerbate renal failure and should not be given to patients with renal impairment.

**Propession Specific Information**

Dental practitioners’ formulary. Oxytetracycline Tablets may be prescribed.

---

**Tetracycline**

**INDICATIONS AND DOSE**

**Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)**

- **BY MOUTH**
  - Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

**Acne**

- **BY MOUTH**
  - Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

**Non-gonococcal urethritis**

- **BY MOUTH**
  - Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

**Interactions**

- Appendix 1: tetracyclines

**Side-effects**

- Acute renal failure · skin discoloration

**Hepatic Impairment**

- Max. 1 g daily in divided doses.

**Renal Impairment**

- May exacerbate renal failure and should not be given to patients with renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

- Tablets should be swallowed whole with plenty of fluid while sitting or standing.

**Patient and Carer Advice**

- Counselling on administration advised.

**Profession Specific Information**

Dental practitioners’ formulary. Tetracycline Tablets may be prescribed.
Chloramphenicol

**DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

- **Life threatening infections particularly those caused by Haemophilus influenzae** | Typhoid fever
  - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Child:** 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicaemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated
  - **BY INTRAVENOUS INJECTION**
    - **Neonate up to 14 days:** 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.
    - **Neonate 14 days to 28 days:** 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials
- **BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
- **Child:** (consult product literature)

**SIDE-EFFECTS**

- **Blood disorders:** depression
- **Diarrhoea:** dry mouth
- **Erythema multiforme:** glossitis
- **Gastrointestinal:** grey syndrome (in neonates)
- **Headache:** nausea
- **Optic neuritis:** nocturnal haemoglobinuria
- **Peripheral neuritis:** reversible and irreversible aplastic anaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.
- With intravenous use in neonates: Grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

**PREGNANCY**

- Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

**BREAST FEEDING**

- Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

**HEPATIC IMPAIRMENT**

- Reduce dose. Avoid if possible—increased risk of bone-marrow depression. Monitor plasma-chloramphenicol concentration in hepatic impairment.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 577

**CAUTIONS**

- Avoid repeated courses and prolonged treatment

**INTERACTIONS**

- Appendix 1: chloramphenicol

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for injection**
  - **ELECTROLYTES:** May contain Sodium
    - Chloramphenicol (as Chloramphenicol sodium succinate)
      - 1 gram Chloramphenicol 1g powder for solution for injection vials | 1 vial (POM) £22.00
      - Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule (POM) £377.00

**DIRECTIONS FOR ADMINISTRATION**

- Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

Fosfomycin

**DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and *Enterobacteriaceae*.

**INDICATIONS AND DOSE**

- **Acute uncomplicated lower urinary-tract infections (in females)**
  - **BY MOUTH USING GRANULES**
    - Child 12-17 years (female): 3 g for 1 dose.

**Osteomyelitis when first-line treatments are inappropriate or ineffective**

- **Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective**
  - **BY INTRAVENOUS INFUSION**
    - Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
    - Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
    - Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
    - Child 1-11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
    - Child 12-17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

- **BY INTRAVENOUS INFUSION**

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

- Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

- Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

- Child 12-17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

Bacterial meningitis when first-line treatment ineffective or inappropriate

- **BY INTRAVENOUS INFUSION**

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

- Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

- Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

- Child 12-17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms.

**CAUTIONS**

- With intravenous use Cardiac insufficiency · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Gastro-intestinal disturbances

- Uncommon Diarrhoea · nausea · rash · vomiting

- Frequency not known Abdominal pain · antibiotic-associated colitis

**SPECIFIC SIDE-EFFECTS**

- Common or very common

- With oral use Diarrhoea · dizziness · headache

- Uncommon

- With intravenous use Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo

- Rare

- With intravenous use Aplastic anaemia · blood disorders · eosinophilia

- Very rare

- With intravenous use Fatty liver · visual impairment

**SIDE-EFFECTS**

- Frequency not known

- With intravenous use Bronchospasm · confusion · hepatitis · jaundice · tachycardia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

- **RENAL IMPAIRMENT**

- With oral use Avoid oral treatment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- With intravenous use Age under 12 years (body-weight under 40 kg)—no information available. Age 12–18 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**

- With intravenous use Monitor electrolytes and fluid balance.

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.

- With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (February 2015) that fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

  The Scottish Medicines Consortium has advised (September 2016) that fosfomycin trometamol (Monuril®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**

  **ELECTROLYTES:** May contain Sodium

  - **Fomicyt** (Nordic Pharma Ltd)

  - **Fosfomycin (as Fosfomycin sodium) 2 gram** Fomicyt 2g powder for solution for infusion vials | 10 vial £150.00

  - **Fosfomycin (as Fosfomycin sodium) 4 gram** Fomicyt 4g powder for solution for infusion vials | 10 vial £300.00

  **Granules**

  **CAUTIONARY AND ADVISORY LABELS 9, 13, 23** EXCIPENTS: May contain Sucrose

  - **Fosfomycin (Non-proprietary)**

  - **Fosfomycin (as Fosfomycin trometamol) 3 gram** Fosfomycin 3g granules sachets | 1 sachet £75.45

  - **Monuril** (Zambon S.p.A.)

  - **Fosfomycin (as Fosfomycin trometamol) 3 gram** Monuril 3g granules sachets | 1 sachet £4.86

  **Capsule**

  - **Fosfomycin (Non-proprietary)**

  - **Fosfomycin calcium 500 mg** Fosfocina 500mg capsules | 24 capsule no price available
Fusidic acid

**DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 250 mg every 12 hours for 5-10 days, dose expressed as sodium fusidate
  - **TO THE SKIN**
  - Child: Apply 3-4 times a day usually for 7 days

**Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials**
- **BY MOUTH USING ORAL SUSPENSION**
  - Neonate: 15 mg/kg 3 times a day.
  - Child 1-11 months: 15 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day
  - Child 12-17 years: 750 mg 3 times a day
  - **BY MOUTH USING TABLETS**
  - Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

**Staphylococcal infections due to susceptible organisms**
- **BY INTRAVENOUS INFUSION**
  - Child (body-weight up to 50 kg): 6-7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

**DOSE EQUIVALENCE AND CONVERSION**
- Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets. 500 mg of sodium fusidate is equivalent to 480 mg fusidic acid.

**CAUTIONS**
- With systemic use: Impaired transport and metabolism of bilirubin
- With topical use: Avoid contact of cream or ointment with eyes

**CAUTIONS, FURTHER INFORMATION**
- Avoiding resistance
- With topical use: To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

**INTERACTIONS** → Appendix 1: fusidic acid

**SIDE-EFFECTS**
- Common or very common
  - With intravenous use: Hepatic disorders - venous intolerance (reduced if given via central vein)
  - With oral use: Abdominal pain - diarrhoea - dyspepsia - nausea - vomiting
  - With systemic use: Dizziness - drowsiness
- Uncommon
  - With systemic use: Anorexia - headache - malaise - pruritus - rash - urticaria
- Rare
  - With topical use: Hypersensitivity reactions
- Frequency not known
  - With oral use: Hepatic disorders
  - With systemic use: Acute renal failure (usually with jaundice) - blood disorders - cholestasis - hepatorenal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatic disorders
- With systemic use: Elevated liver enzymes, hyperbiliurinaemia and jaundice can occur—these effects are usually reversible following withdrawal of therapy.

**PREGNANCY**
- With systemic use: Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- With systemic use: Present in milk—manufacturer advises caution.

**HEPATIC IMPAIRMENT**
- With systemic use: Manufacturer advises caution—monitor liver function periodically during treatment.

**MONITORING REQUIREMENTS**
- With systemic use: Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

**DIRECTIONS FOR ADMINISTRATION**
- Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include banana and orange.

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary
  - May be prescribed as Sodium Fusidate ointment.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 9, 21
- **Fucidin (Sodium fusidate)** (LEO Pharma)
  - Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet | £6.02 DT price = £6.02 | 100 tablet | £54.99

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 9, 21
- **Fucidin (Fusidic acid)** (LEO Pharma)
  - Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 50 ml | £6.73 DT price = £6.73

**Powder and solvent for solution for infusion**

**ELECTROLYTES:** May contain Sodium
- **Fucidic acid (Non-proprietary)**
  - Sodium fusidate 500 mg Fusidin 500mg powder and solvent for solution for infusion vials | 1 vial | £38.00

**Cream**

**EXCIPIENTS:** May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)
- **Fucidic acid (Non-proprietary)**
  - Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram | £1.92 DT price = £1.80 | 30 gram | £3.60 DT price = £3.60
  - **Fucidin (Fusidic acid)** (LEO Pharma)
  - Fusidic acid 20 mg per 1 gram Fucidin 20mg/g cream | 15 gram | £1.92 DT price = £1.80 | 30 gram | £3.59 DT price = £3.60

**Ointment**

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin
- **Fucidin (Sodium fusidate)** (LEO Pharma)
  - Sodium fusidate 20 mg per 1 gram Fucidin 20mg/g ointment | 15 gram | £2.68 DT price = £2.68 | 30 gram | £4.55 DT price = £4.55
Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

- **INDICATIONS AND DOSE**

  **Pneumonia** (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.
    - Neonate 7 days to 28 days: 10 mg/kg every 8 hours.
    - Child 1 month–1 year: 10 mg/kg every 8 hours (max. per dose 600 mg)
    - Child 12–17 years: 600 mg every 12 hours

- **UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE (OPTIC NEUROPATHY)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS**

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CAUTIONS** Acute confusional states, bipolar depression, carcinoid tumour, phaeochromocytoma, schizophrenia, thyrotoxicosis, uncontrolled hypertension

- **CAUTIONS, FURTHER INFORMATION**
  - **Close observation** Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

**INTERACTIONS** Appendix 1: linezolid

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Diarrhoea - eosinophilia - headache - nausea - taste disturbances - vomiting
- **Rare** Renal failure - tachycardia - transient ischaemic attacks
- **Frequency not known** Anaemia - antibiotic-associated colitis - convulsions - hyponatraemia - lactic acidosis - optic neuropathy reported on prolonged therapy - pancytopenia - peripheral neuropathy reported on prolonged therapy - Stevens-Johnson syndrome - tooth discoloration - toxic epidermal necrolysis

**SPECIFIC SIDE-EFFECTS**

- **Uncommon**
  - With intravenous use - Injection-site reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk — no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** No dose adjustment necessary but in severe hepatic impairment use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.

**DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

There is limited information on use in children and expert advice should be sought.

**PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

**EXCIPIENTS:** May contain Glucose

**ELECTROLYTES:** May contain Sodium

- **Linezolid (Non-proprietary)**
  - Linezolid 2 mg per 1 ml Linezolid 600mg/300ml infusion bags | 10 bag [PSh] £44.50 (Hospital only)
  - Zyvox (Pfizer Ltd) Linezolid 2 mg per 1 ml Zyvox 600mg/300ml infusion bags | 10 bag [PSh] £45.00

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 9, 10

**EXCIPIENTS:** May contain Aspartame

- **Zyvox (Pfizer Ltd)**
  - Linezolid 20 mg per 1 ml Zyvox 100mg/5ml granules for oral suspension | 150 ml [PSh] £222.50

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 9, 10

- **Linezolid (Non-proprietary)**
  - Linezolid 600 mg Linezolid 600mg tablets | 10 tablet [PSh] £82.12–£84.50 DT price = £323.32
  - Zyvox (Pfizer Ltd) Linezolid 600 mg Zyvox 600mg tablets | 10 tablet [PSh] £445.00 DT price = £323.32
**Trimethoprim**

- **INDICATIONS AND DOSE**
  - Urinary-tract infections | Respiratory tract infections
    - **BY MOUTH**
      - Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.
      - Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
      - Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
      - Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
      - Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
      - Child 12–17 years: 200 mg twice daily
  - **Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
    - **BY MOUTH**
      - Neonate: 2 mg/kg once daily, dose to be taken at night.
      - Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
      - Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
      - Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
      - Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
      - Child 12–17 years: 100 mg once daily, dose to be taken at night

- **Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)**
  - **BY MOUTH**
    - Child: 5 mg/kg every 6–8 hours

- **Shigellosis | Invasive salmonella infection**
  - **BY MOUTH**
  - Child: (consult product literature)

- **UNLICENSED USE**

- **CONTRA-INDICATIONS**
  - Blood dyscrasias

- **CAUTIONS**
  - Acute porphyrias p. 577 - neonates (specialist supervision required) - predisposition to folate deficiency

- **INTERACTIONS**
  - Appendix 1: trimethoprim

- **SIDE-EFFECTS**
  - Rare
    - Allergic reactions - anaphylaxis - angioedema - erythema multiforme - photosensitivity - toxic epidermal necrolysis
  - Frequency not known
    - Aseptic meningitis - depression of haemopoiesis - gastro-intestinal disturbances - hyperkalaemia - nausea - pruritus - rashes - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

- **PREGNANCY**
  - Teratogenic risk in first trimester (folate antagonist).
  - Manufacturers advise avoid during pregnancy.

- **BREAST FEEDING**
  - Present in milk—short-term use not known to be harmful.

- **RENA L IMPAIRMENT**
  - Use half normal dose after 3 days if estimated glomerular filtration rate

  15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

- **PATIENT AND CARER ADVICE**
  - Blood disorders
    - On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

  **Combinations available: Co-trimoxazole, p. 335**

---

### 2.1 Anthrax

**Anthrax**

**Treatment and post-exposure prophylaxis**

*Inhalation or gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 333 or, in patients over 12 years, doxycycline p. 338 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 325, benzylpenicillin sodium p. 323, chloramphenicol p. 340, clarithromycin p. 315, clindamycin p. 313, imipenem with cilastatin p. 302, rifampicin p. 349 [unlicensed indication], and vancomycin p. 312). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

**Cutaneous anthrax** should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against
anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Lyme disease

**Lyme disease**

**Treatment**

Amoxicillin p. 325 [unlicensed indication], cefuroxime p. 306 (as cefuroxime axetil) or doxycycline p. 338 are the antibacterials of choice for early Lyme disease or Lyme arthritis but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated, a macrolide (e.g. clarithromycin p. 315) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 308, cefotaxime p. 307, or benzylpenicillin sodium p. 323 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.3 Methicillin-resistant staphylococcus aureus

**MRSA**

**Management**

Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 330 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 349 or fusidic acid p. 342 should not be used alone because resistance may develop rapidly. Clindamycin p. 313 alone or a combination of rifampicin and fusidic acid can be used for skin and soft-tissue infections caused by MRSA; a tetracycline is an alternative in children over 12 years of age. A glycopeptide (e.g. vancomycin p. 312) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 343 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A glycopeptide can be used for pneumonia associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim p. 344 or nitrofurantoin p. 354 can be used for urinary-tract infections caused by MRSA; a tetracycline is an alternative in children over 12 years of age. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicaemia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 311 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 665.

2.4 Tuberculosis

**Tuberculosis**

**Treatment phases, overview**

Active tuberculosis is treated in two phases—an initial phase using four drugs and a continuation phase using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

**Initial phase**

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed dose combination preparations unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance, intolerance or an inappropriate dose combination. The treatment of choice for the initial phase is the daily use of rifampicin p. 349, ethambutol hydrochloride p. 351, pyrazinamide p. 353 and isoniazid p. 352 (with pyridoxine hydrochloride p. 600 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.

**Continuation phase**

After the initial phase, daily treatment is continued for a further 4 months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment**

The unsupervised treatment regimen should be used for children who are likely to take antituberculosis drugs reliably
Bacterial infection

infection is suspected, the baby will require treatment with extrapulmonary sites at birth, particularly the genital tract; if Congenital tuberculosis is acquired from maternal

The standard unsupervised administration of therapy should be treated with the families who are unable or unlikely to comply with daily

without supervision by a healthcare worker. Children and families who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Neonates

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride). This regimen is used for 2 months during the initial phase of treatment.

After the initial phase, rifampicin and isoniazid with pyridoxine hydrochloride is continued for a further 4 months.

Supervised treatment

Drug administration should be fully supervised by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to children or to children whose carers:

- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;

have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

Advice and support should be offered to these children and their carers to assist with treatment completion.

Immunocompromised patients

Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed M. tuberculosis infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a child who is HIV-positive (see also Latent tuberculosis below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed 6 months in children who are HIV-positive, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Infection may also be caused by other mycobacteria e.g. M. avium complex, in which case specialist advice on management is needed.

Extrapulmonary tuberculosis

Central nervous system tuberculosis

Children with central nervous system tuberculosis should be offered rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) for two months. After completion of the initial treatment phase,
rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further 10 months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose dexamethasone p. 419 or prednisolone p. 421 should be started at the same time as antituberculosis therapy and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in children who have raised intracranial pressure.

Pericardial tuberculosis

An initial high dose of oral prednisolone should be offered to children with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

Latent tuberculosis

Clinicians should be aware that some groups of children with latent tuberculosis are at increased risk of developing active tuberculosis (such as children who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These children and their carers should be advised of the risks and symptoms of active tuberculosis.

Close contacts

All children who are a close contact (prolonged, frequent or intense contact, e.g. household contacts or relations) of a person with confirmed pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Children under 2 years should be assessed by a specialist.

Immunocompromised

Children in whom latent tuberculosis is suspected and who are anticipated to be, or who are currently immunocompromised (for example, if they are from a high incidence country or have been in close contact with people with suspected infectious or confirmed pulmonary or laryngeal tuberculosis), should be referred to a tuberculosis specialist.

Chemoprophylaxis for latent tuberculosis

Neonates who have been in close contact with a person with tuberculosis which has not yet been treated for at least two weeks, should be treated with isoniazid p. 352 (with pyridoxine hydrochloride p. 600) followed by a Mantoux test after six weeks of treatment. If the test is positive (and active tuberculosis is not present) treatment should be continued for six months; if negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given.

Children aged 4 weeks to 2 years who have been in close contact with a person with tuberculosis which has not been treated for at least two weeks, should be treated with either isoniazid (with pyridoxine hydrochloride) alone for six months (preferred regimen if interactions with rifamycins are a concern) or rifampicin p. 349 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern); and then have a Mantoux test. If the test is positive (and active tuberculosis is not present), the treatment course should be completed. If the test is negative, treatment should be continued and re-assessed after 6 weeks. If the results are then negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given (if the child has not already had one). If the result is positive (and active tuberculosis is not present), the course of treatment should be continued.

Children aged over 2 years should be offered a Mantoux test, and if positive (and active tuberculosis is not present), then treated as above for children aged 4 weeks to 2 years. If the test is negative, reassess after 6 weeks.

Testing for hepatitis B and hepatitis C should be considered before starting treatment for tuberculosis as this may affect the choice of therapy. Children with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in children with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis and tuberculin testing under Vaccines p. 747.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.

Treatment interruptions

A break in antituberculosis treatment of at least two weeks (during the initial phase), or missing more than 20 % of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

Treatment interruptions due to drug-induced hepatotoxicity

Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially reintroduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 351 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In children with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 299 (with or without a quinolone, such as levofloxacin p. 648 or moxifloxacin p. 648), and with ongoing monitoring by a liver specialist.

Treatment interruptions due to cutaneous reactions

If a child with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with a low risk of causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin with monitoring by a dermatologist.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients. Rifabutin p. 348 is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide p. 353 is a bactericidal drug only active against intracellular dividing forms of Mycobacterium
tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low. Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (resistance to isoniazid and rifampicin, or without any other resistance) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin p. 298, capreomycin, cycloserine p. 351, newer macrolides (e.g. azithromycin p. 314 and clarithromycin p. 315), moxifloxacin p. 648 and protonamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

Single drug-resistant tuberculosis

For single drug-resistance the following treatment regimen is recommended:

Resistance to isoniazid p. 352:
- First two months (initial phase): rifampicin p. 349, pyrazinamide p. 353 and ethambutol hydrochloride p. 351
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

Resistance to pyrazinamide:
- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride p. 600)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

Resistance to ethambutol hydrochloride:
- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

Resistance to rifampicin:
- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

ANTIMYCOBACTERIALS  RIFAMYCINS

Rifabutin

- **INDICATIONS AND DOSE**
  - **Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count**
    - **BY MOUTH**
      - Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
      - Child 12–17 years: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- **BY MOUTH**
  - Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative
  - Child 12–17 years: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Child 12–17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 577  - discoulours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifabutin
- **SIDE-EFFECTS**
  - **Common or very common** Anaemia  - blood disorders  - leucopenia  - myalgia  - nausea  - pyrexia  - rash  - thrombocytopenia
  - **Uncommon** Arthralgia  - body secretions coloured orange-red  - bronchospasm  - corneal deposits  - eosinophilia  - hypersensitivity reactions  - jaundice  - raised liver enzymes  - saliva coloured orange-red  - skin coloured orange-red  - urine coloured orange-red  - uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration)  - vomiting
  - **Rare** Haemolysis
  - **Frequency not known** Chest pain  - dyspnoea  - hepatitis  - influenza-like symptoms

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue permanently if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION**
  - Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - **Renal function** should be checked before treatment.
  - **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
  - Blood counts should be monitored on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- **PATIENT AND CARER ADVICE**
  - Soft contact lenses Patients or their carers should be advised that rifabutin discoulours soft contact lenses.
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical advice.
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical advice.
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical advice.
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical advice.
attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8, 14
- **Mycobutin** (Pfizer Ltd)
  - Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule £50.39

### Rifampicin

#### INDICATIONS AND DOSE

**Brucellosis in combination with other antibiotics**
**Legionnaires disease in combination with other antibiotics**
**Serious staphylococcal infections in combination with other antibiotics**

BY MOUTH, OR BY INTRAVENOUS INFUSION

- **Neonate**: 5–10 mg/kg twice daily.
- **Child**: 1–11 months: 5–10 mg/kg twice daily. Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH

- **Child**: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH

- **Child (body-weight up to 50 kg)**: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- **Child (body-weight 50 kg and above)**: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

**Congenital tuberculosis**

BY MOUTH

- **Neonate**: 15 mg/kg once daily for 6 months (initial and continuation phases).

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid**

BY MOUTH

- **Child 1 month–11 years (body-weight up to 50 kg)**: 15 mg/kg daily for 3 months; maximum 450 mg per day
- **Child 1 month–11 years (body-weight 50 kg and above)**: 15 mg/kg daily for 3 months; maximum 600 mg per day
- **Child 12–17 years (body-weight up to 50 kg)**: 450 mg daily for 3 months
- **Child 12–17 years (body-weight 50 kg and above)**: 600 mg daily for 3 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant**

BY MOUTH

- **Child 1 month–11 years (body-weight up to 50 kg)**: 15 mg/kg daily for 6 months; maximum 450 mg per day
- **Child 1 month–11 years (body-weight 50 kg and above)**: 15 mg/kg daily for 6 months; maximum 600 mg per day

**Prevention of secondary case of Haemophilus influenzae type b disease**

BY MOUTH

- **Child 1–2 months**: 10 mg/kg once daily for 4 days
- **Child 3 months–11 years**: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- **Child 12–17 years**: 600 mg once daily for 4 days

**Prevention of secondary case of meningococcal meningitis**

BY MOUTH

- **Neonate**: 5 mg/kg every 12 hours for 2 days.
- **Child**: 5–10 mg/kg once daily (max. per dose 600 mg)

#### UNLICENSED USE
Not licensed for use in children for pruritus due to cholestasis.

#### CONTRA-INDICATIONS
Acute porphyrias p. 577 · jaundice

#### CAUTIONS
Discourages soft contact lenses

#### INTERACTIONS
Appendix 1: rifampicin

#### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza–like symptoms (with chills, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

**SPECIFIC SIDE-EFFECTS**

With intravenous use: Thrombophlebitis reported if infusion used for prolonged period

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop.

### Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza–like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with rifampicin hypersensitivity.

#### CONCEPTION AND CONTRACEPTION

Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

**PREGNANCY**

Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

**BREAST FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function.
regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

- **RENAL IMPAIRMENT** Use with caution if doses above 10 mg/kg daily.

- **MONITORING REQUIREMENTS**
  - Renal function should be checked before treatment.
  - Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
  - Blood counts should be monitored in patients on prolonged therapy.

- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

- **PRESERVING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
  - With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

- **PATIENT AND CARER ADVICE**
  - Soft contact lenses Patients or their carers should be advised that rifampicin discoulours soft contact lenses. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

  **Oral suspension**
  - **Rifadin** (Sanofi)
  - **Rifapicin 20 mg per 1 ml** Rifadin 100mg/5ml syrup | 120 ml | 25

  **Capsule**
  - **Rifadin** (Sanofi)
  - **Rifapicin 150 mg** Rifadin 150mg capsule | 100 capsule | 25
  - **Rifater** (Sanofi)
  - **Rifapicin 300 mg** Rifater 300mg capsule | 100 capsule | 25

  **Rimactane** (Sandoz Ltd)
  - **Rifapicin 300 mg** Rimactane 300mg capsule | 60 capsule | 25

- **INDICATIONS AND DOSE**
  - **Treatment of tuberculosis (continuation phase)**
    - **BY MOUTH**
    - Child: Although not licensed in children, consideration may be given to use of Rifinah® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).

  **DOSE EQUIVALENCE AND CONVERSION**
  - Rifinah® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
    - Each Rifinah® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
    - Each Rifinah® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

- **UNLICENSED USE** Not licensed for use in children.

- **INTERACTIONS** → Appendix 1: isoniazid, rifampicin

- **PATIENT AND CARER ADVICE**

- **MEDICAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 8, 14, 23
    - **Rifinah** (Sanofi)
    - Isoniazid 100 mg, Rifampicin 150 mg Rifinah 150mg tablets | 84 tablet | 25
    - Isoniazid 150 mg, Rifampicin 300 mg Rifinah 300mg tablets | 56 tablet | 25

- **Rifampicin with isoniazid and pyrazinamide**

  The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 349, isoniazid p. 352.

  **INDICATIONS AND DOSE**
  - **Initial treatment of tuberculosis (in combination with ethambutol)**
    - Child: Although not licensed in children, consideration may be given to use of Rifater® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).

  **DOSE EQUIVALENCE AND CONVERSION**
  - Tablet quantities refer to the number of Rifater® Tablets which should be taken. Each Rifater® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

  **UNLICENSED USE** Not licensed for use in children.
Ethambutol hydrochloride

**INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**
- **BY MOUTH**
  - Child: 20 mg/kg once daily for 2 months (initial phase)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**
- **BY MOUTH**
  - Child: 30 mg/kg 3 times a week for 2 months (initial phase)

**Congenital tuberculosis, in combination with other drugs**
- **BY MOUTH**
  - Neonate: 20 mg/kg once daily for 2 months (initial phase).

**CONTRA-INDICATIONS**
- Optic neuritis • poor vision

**CAUTIONS**
- Young children

**CAUTIONS, FURTHER INFORMATION**
- **Understanding warnings** Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

**INTERACTIONS**
- Appendix 1: ethambutol

**SIDE-EFFECTS**
- Rare: Pruritus • rash • thrombocytopenia • urticaria
- Frequency not known: Colour blindness • loss of visual acuity • optic neuritis • peripheral neuritis • red/green colour blindness • restriction of visual fields • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
- Ocular toxicity: Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

**PREGNANCY**
- Not known to be harmful.

**BREAST FEEDING**
- Amount too small to be harmful.

**RENAL IMPAIRMENT**
- If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week. Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute/1.73 m², monitor plasma-ethambutol concentration.

**MONITORING REQUIREMENTS**
- ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
- Renal function should be checked before treatment.
- Visual acuity should be tested by Snellen chart before treatment with ethambutol.
- In young children, routine ophthalmological monitoring recommended.

**PATIENT AND CARER ADVICE**
- Ocular toxicity: The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

**Isoniazid**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 8
  - Ethambutol hydrochloride (Non-proprietary)
    - **Ethambutol hydrochloride 100 mg**
      - 56 tablet [POM] £11.51 DT price = £11.51
    - **Ethambutol hydrochloride 400 mg**
      - 56 tablet [POM] £42.74 DT price = £42.74

**INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**
- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**
- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

**Congenital tuberculosis, in combination with other drugs**
- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive**
- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Neonate: 10 mg/kg daily for 6 months.

- Child 1 month-11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin.
- Child 12-17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin.

**CONTRA-INDICATIONS** Drug-induced liver disease

**CAUTIONS** Acute porphyrias p. 577, alcohol dependence, diabetes mellitus, epilepsy, history of psychosis, HIV infection, malnutrition, slow acetylator status (increased risk of side-effects)

**CAUTIONS, FURTHER INFORMATION**
- Peripheral neuropathy. Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 600 should be given prophylactically from the start of treatment.

**INTERACTIONS** Appendix 1: isoniazid

**SIDE-EFFECTS**
- Common or very common Peripheral neuropathy
- Rare Hepatitis, psychotic episodes
- Frequency not known Agranulocytosis, aplastic anaemia, blood disorders, constipation, convulsions, difficulty with micturition, dry mouth, fever, gynaecomastia, haemolytic anaemia, hearing loss (in patients with end-stage renal impairment), hyperglycaemia, hyperreflexia, hypersensitivity reactions, interstitial pneumonitis, nausea, optic neuritis, pancreatitis, pellagra, peripheral neuropathy with high doses, purpura, Stevens-Johnson syndrome, systemic lupus erythematosus-like syndrome, tinnitus (in patients with end-stage renal impairment), vertigo, vomiting

**PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

**BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. Monitor infant for possible toxicity.

**RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 600 recommended.

**MONITORING REQUIREMENTS**
- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

**PRESCRIBING AND DISPENSING INFORMATION** Doses may need to be recalculated to allow for weight gain in younger children.
- With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.

**PATIENT AND CARER ADVICE**
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

### Pyrazinamide

#### INDICATIONS AND DOSE

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)

**Congenital tuberculosis, in combination with other drugs**

- **BY MOUTH**
  - Neonate: 35 mg/kg once daily for 2 months (initial phase).

#### CAUTIONS

- Diabetes

#### INTERACTIONS

- Appendix 1: pyrazinamide

#### SIDE-EFFECTS

- Anorexia · arthralgia · dysuria · fever · hepatomegaly · hepatotoxicity · jaundice · liver failure · nausea · photosensitivity · rash · sideroblastic anaemia · splenomegaly · thrombocytopenia · vomiting

#### PREGNANCY

- Manufacturer advises use only if potential benefit outweighs risk.

#### BREAST FEEDING

- Amount too small to be harmful.

#### HEPATIC IMPAIRMENT

- Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

#### RENAL IMPAIRMENT

- If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.

#### MONITORING REQUIREMENTS

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

#### PRESCRIBING AND DISPENSING INFORMATION

- In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

#### PATIENT AND CARER ADVICE

- Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Combinations available: Rifampicin with isoniazid and pyrazinamide, p. 350

### 2.5 Urinary tract infections

#### Urinary-tract infections

**Overview**

Urinary-tract infection is more common in adolescent girls than in boys; when it occurs in adolescent boys there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella spp.* *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in children under 3 years of age;
- in children with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing;
- in pregnant women.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

**Antibacterial therapy for urinary-tract infections**

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring.

- **Children under 3 months of age** should be transferred to hospital and treated initially with intravenous antibacterials such as amoxicillin p. 325 (or ampicillin p. 326) with gentamicin p. 299, or a cephalosporin (such as cefotaxime p. 307) alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

- **Children over 3 months of age with uncomplicated lower urinary-tract infection**, can be treated with trimethoprim p. 344 or nitrofurantoin p. 354. **Suggested duration of treatment** 3 days. Re-assess child if they remain unwell 24–48 hours after initial assessment.

- Alternatively, **children over 3 months of age, with uncomplicated lower urinary-tract infection**, may be treated with amoxicillin (or ampicillin) or oral first generation cephalosporin (e.g. cefalexin p. 304). Use amoxicillin only if...
micro-organism sensitive. Suggested duration of treatment 3 days. Re-assess child if unwell 24–48 hours after initial assessment.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav p. 328 for 7–10 days.

If the patient is severely ill, then the infection is best treated initially by intravenous injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Resistant infections
Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam hydrochloride p. 330, or a quinolone.

Antibacterial prophylaxis
Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage. Nitrofurantoin is contra-indicated in children under 3 months of age because of the theoretical possibility of haemolytic anaemia.

Pregnancy
Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment
In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS

Nitrofurantoin

- **INDICATIONS AND DOSE**
  - **Acute uncomplicated urinary-tract infections**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
      - Child 12–17 years: 50 mg 4 times a day for 3–7 days
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Child 12–17 years: 100 mg twice daily, dose to be taken with food
  - **Severe chronic recurrent urinary-tract infections**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12–17 years: 100 mg 4 times a day for 3–7 days
  - **Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
      - Child 12–17 years: 50–100 mg once daily, dose to be taken at night

- **CONTRA-INDICATIONS** Acute pyrophorias p. 577. G6PD deficiency - infants less than 3 months old
- **CAUTIONS** Anaemia; diabetes mellitus; electrolyte imbalance; folate deficiency; pulmonary disease; susceptibility to peripheral neuropathy; urine may be coloured yellow or brown; vitamin B deficiency
- **INTERACTIONS** → Appendix 1: nitrofurantoin
- **SIDE-EFFECTS**
  - **Rare** Agranulocytosis - aplastic anaemia - arthralgia - benign intracranial hypertension - blood disorders - cholestatic jaundice - erythema multiforme - exfoliative dermatitis - hepatitis - pancreatitis - thrombocytopenia - transient alopecia
  - **Frequency not known** Acute pulmonary reactions - anaphylaxis - angioedema - anorexia - chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) - diarrhoea - hypersensitivity reactions - nausea - peripheral neuropathy - pruritus - rash - sialadenitis - urticaria - vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolyis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

3 Fungal infection

Antifungals, systemic use

Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 361 is the treatment of choice for aspergillosis; liposomal amphotericin p. 357 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 361 or itraconazole p. 360 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 358 can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, either amphotericin by intravenous infusion or an echinocandin can be used. Fluconazole is an alternative for Candida albicans infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 363 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV–positive patients, can be life–threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV–positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non–meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 696 are used more frequently than griseofulvin p. 363 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by T. tonsurans or Microsporum spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth. If topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against Aspergillus spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 357 can be used for prophylaxis of candidiasis in patients undergoing...
haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 492, econazole nitrate p. 492, ketoconazole p. 695, and tioconazole p. 696. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 493 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin and nystatin p. 680; neither drug is absorbed when given by mouth. Nystatin p. 680 is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for Candida albicans infection of the skin.

Amphotericin p. 357 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin below and micafungin p. 357. They are only active against Aspergillus spp. and Candida spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 363 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 363 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophytin infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 696 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

- INDICATIONS AND DOSE
  - Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia
  - BY INTRAVENOUS INFUSION
    - Neonate: 25 mg/m² once daily.
    - Child 1-2 months: 25 mg/m² once daily
    - Child 3-11 months: 50 mg/m² once daily
    - Child 1-17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises increase dose to 70 mg/m² daily (max. 70 mg daily) with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin).

- INTERACTIONS
  - Appendix 1: caspofungin

- SIDE-EFFECTS
  - Common or very common
    - Arthralgia | diarrhoea | dyspnoea | flushing | headache | hypokalaemia | hypomagnesaemia | hypotension | injection-site reactions | nausea | pruritus | rash | sweating | tachycardia | vomiting
  - Uncommon
    - Abdominal pain | anaemia | anorexia | anxiety | arrhythmia | ascites | blurred vision | bronchospasm | chest pain | cholestasis | constipation | cough | disorientation | dizziness | dry mouth | dyspepsia | dysphagia | erythema multiforme | fatigue | flatulence | heart failure | hepatic dysfunction | hyperglycaemia | hypertension | hypoaesthesia | hypocalcaemia | leucopenia | metabolic acidosis | muscular weakness | myalgia | palpitation | paraesthesia | renal failure | sleep disturbances | taste disturbances | thrombocytopenia | thrombophlebitis | tremor
  - Frequency not known
    - Acute respiratory distress syndrome | anaphylaxis | hypercalcaemia

- PREGNANCY
  - Manufacturer advises avoid unless essential—toxicity in animal studies.

- BREAST FEEDING
  - Present in milk in animal studies—manufacturer advises avoid.

- HEPATIC IMPAIRMENT
  - Usual initial dose, then use 70% of normal maintenance dose in moderate impairment. No information available for severe impairment.

- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion (Candidas®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding
500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Candida** (Merck Sharp & Dohme Ltd)
  - Caspofungin (as Caspofungin acetate) 50 mg: Candida 50mg powder for solution for infusion vials | 1 vial [Pack] £327.67
  - Caspofungin (as Caspofungin acetate) 70 mg: Candida 70mg powder for solution for infusion vials | 1 vial [Pack] £416.78

**Micafungin**

**INDICATIONS AND DOSE**

**Invasive candidiasis**
- **BY INTRAVENOUS INFUSION**
  - Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.
  - Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
  - Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

**Oesophageal candidiasis**
- **BY INTRAVENOUS INFUSION**
  - Child 16–17 years (body-weight up to 40 kg): 3 mg/kg once daily
  - Child 16–17 years (body-weight 40 kg and above): 150 mg once daily

**Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.
  - Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
  - Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

**INTERACTIONS** → Appendix 1: micafungin

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain • anaemia • blood pressure changes • diarrhoea • fever • headache • hepatomegaly • hypocalcaemia • hypokalaemia • hypomagnesaemia • leucopenia • nausea • phlebitis • rash • renal failure • tachycardia • thrombocytopenia • vomiting
- **Uncommon** Anorexia • anxiety • bradycardia • cholestasis • confusion • constipation • dizziness • dyspepsia • dyspnoea • eosinophilia • flushing • hepatitis • hyperhidrosis • hyperkalaemia • hyponatraemia • hypophosphataemia • palpitation • pancytopenia • pruritus • sleep disturbances • tachycardia • taste disturbances • tremor
- **Rare** Haemolytic anaemia
- **Frequency not known** Disseminated intravascular coagulation • hepatotoxicity (potentially life-threatening; more common in children under 1 year) • Stevens–Johnson syndrome • toxic epidermal necrolysis

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

**MONITORING REQUIREMENTS**
- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

**ANTIFUNGALS** → POLYENE ANTIFUNGALS

**Amphotericin**

(Amphotericin B)

**INDICATIONS AND DOSE**

**ABELCET®**

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningoencephalitis and disseminated cryptococcosis in HIV patients

- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day
  - Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

**AMBISOME®**

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day
  - Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Visceral leishmaniasis (unresponsive to the antimonial alone)**

- **BY INTRAVENOUS INFUSION**
  - Child: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®**

Systemic fungal infections

- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.
- Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually.

- **UNLICENSED USE**
  - **AMBISOME®** AmBisome® not licensed for use in children under 1 month.
  - **FUNGIZONE®** Intravenous conventional formulation amphotericin (Fungizone®) is licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  - Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose).

- **CAUTIONS, FURTHER INFORMATION**
  - Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1: amphotericin

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - abnormal liver function (discontinue treatment) - anaemia - arrhythmias - blood disorders - blood pressure changes - cardiovascular effects - chest pain - diarrhoea - disturbances in renal function - dyspnoea - electrolyte disturbances - febrile reactions - headache - hypokalaemia - hypomagnesaemia - nausea - rash - renal tubular acidosis - thrombocytopenia - vomiting
  - **Uncommon** Anaphylactoid reactions - bronchospasm - convulsions - diplopia - encephalopathy - hearing loss - neurological disorders - peripheral neuropathy - tremor
  - **Frequency not known** Anorexia - arthralgia - myalgia - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.
  - **BREAST FEEDING** No information available.
  - **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

- **DIRECTIONS FOR ADMINISTRATION**
  - **ABELCET®** Amphotericin (lipid complex)
    - For intravenous infusion, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20–ML syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably given via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.
  - **AMBISOME®** Amphotericin (liposomal)
    - For intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Different preparation of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Suspension for infusion**
    - **ELECTROLYTES**: May contain Sodium
      - **ABELCET** (Teva UK Ltd)
        - Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL
        - Abelcet 100mg/20mL concentrate for suspension for infusion vials | 10 vial £775.04 (Hospital only)
    - **Powder for solution for infusion**
      - **EXCIPIENTS**: May contain Sucrose
        - **ELECTROLYTES**: May contain Sodium
      - **AMBISOME** (Gilead Sciences International Ltd)
        - Amphotericin B liposomal 50 mg AmBisome 50mg powder for solution for infusion vials | 10 vial £821.87
        - **FUNGIZONE** (Bristol-Myers Squibb Pharmaceuticals Ltd)
          - Amphotericin B 50 mg Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial £3.88

- **Candidal balanitis**
  - **Fluconazole**
    - **BY MOUTH**
      - Child 16–17 years: 150 mg for 1 dose

- **Vaginal candidiasis**
  - **BY MOUTH**
    - Child 1 month–15 years: 150 mg for 1 dose, for use in patients who are post-puberty
    - Child 16–17 years: 150 mg for 1 dose

- **Vulvovaginal candidiasis (recurrent)**
  - **BY MOUTH**
    - Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty
Mucosal candidiasis (except genital)
- **Neonate up to 14 days:** 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.
- **Neonate 14 days to 28 days:** 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.
- **Child 1 month-11 years:** 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections).
- **Child 12-17 years:** 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections.

**Tinea capitis**
- **BY MOUTH**
  - Child 1-7 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks.

**Tinea pedis, corporis, cruris, pityriasis versicolor**
- **DY MOUTH**
  - Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks.

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**

**Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 6 mg/kg daily (max. per dose 200 mg)

- **UNLICENSED USE** Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with AIDS.

- **CONTRA-INDICATIONS** 
  - Acute porphyrias
  - Pregnancy

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**
  - Common or very common
    - Abdominal discomfort, diarrhoea, flatulence, headache, nausea, rash
  - Uncommon
    - Alopecia, anaphylaxis, angioedema, dizziness, dyspepsia, hepatic disorders, hyperlipidaemia, pruritus, seizures, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, vomiting
  - Frequency not known
    - Hypokalaemia, leucopenia, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
- If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.
- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Toxicity with related drugs.

- **RENAL IMPAIRMENT** Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Fluconazole Capsules 50 mg may be prescribed.
    - Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium
- Fluconazole (Non-proprietary)
  - **Fluconazole 2 mg per 1 ml** Fluconazole 100mg/50ml solution for infusion bottles | 5 bottle £12.60
  - Fluconazole 200mg/100ml solution for infusion vials | 1 vial £29.28
  - Fluconazole 50mg/25ml solution for infusion vials | 1 vial £7.31–£7.32
  - Fluconazole 200mg/100ml solution for infusion bottles | 5 bottle £27.50
  - Diflucan (Pfizer Ltd)
  - **Fluconazole 2 mg per 1 ml** Diflucan 200mg/100ml solution for infusion vials | 1 vial £29.28

**MNEMONIC:**

- BNFC 2017–2018
- Infection
- 359

- Prevention of fungal infections in immunocompromised patients
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.
    - Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.
    - Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia.
  - Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range
**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

- Fluconazole (Non-proprietary)
  - Fluconazole 10 mg per 1 ml: Fluconazole 50mg/5ml oral suspension | 35 ml (POD) £20.51 DT price = £20.51
  - Diflucan (Pfizer Ltd)
  - Fluconazole 10 mg per 1 ml: Diflucan 50mg/5ml oral suspension | 35 ml (POD) £16.61 DT price = £20.51
  - Fluconazole 40 mg per 1 ml: Diflucan 200mg/5ml oral suspension | 35 ml (POD) £66.42 DT price = £66.42

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- Fluconazole (Non-proprietary)
  - Fluconazole 50 mg: Fluconazole 50mg capsules | 7 capsule (POD) £5.00 DT price = £9.91
  - Fluconazole 150 mg: Fluconazole 150mg capsules | 1 capsule (POD) no price available DT price = £9.84 | 1 capsule (POD) £8.50 DT price = £9.84
  - Fluconazole 200 mg: Fluconazole 200mg capsules | 7 capsule (POD) £6.02 DT price = £6.02
  - Diflucan (Pfizer Ltd)
  - Fluconazole 50 mg: Diflucan 50mg capsules | 7 capsule (POD) £16.61 DT price = £9.91
  - Fluconazole 150 mg: Diflucan 150mg capsules | 1 capsule (POD) £7.12 DT price = £9.84
  - Fluconazole 200 mg: Diflucan 200mg capsules | 7 capsule (POD) £66.42 DT price = £6.02

---

**Itraconazole**

- **INDICATIONS AND DOSE**

  **Oropharyngeal candidiasis**
  - **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day
  - Child 12–17 years: 100 mg once daily for 15 days

  **Oropharyngeal candidiasis in patients with AIDS or neutropenia**
  - **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day
  - Child 12–17 years: 200 mg once daily for 15 days

  **Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
  - **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
  - **BY INTRAVENOUS INFUSION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

  **Pityriasis versicolor**
  - **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days
  - Child 12–17 years: 200 mg once daily for 7 days

  **Tinea pedis | Tinea manuum**
  - **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days
  - Child 12–17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

  **Tinea corporis | Tinea cruris**
  - **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days
  - Child 12–17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

---

**Tinea capitis**

- **BY MOUTH**
  - Child 1–17 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

**Onychomycosis**

- **BY MOUTH**
  - Child 11–17 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses
  - Child 12–17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**

- **BY INTRAVENOUS INFUSION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Histoplasmosis**

- **BY MOUTH**
  - Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**

- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
  - **BY INTRAVENOUS INFUSION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

- **BY MOUTH USING ORAL SOLUTION**
  - Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

---

**UNLICENSED USE**

Not licensed for use in children (age range not specified by manufacturer).

---

**IMPORTANT SAFETY INFORMATION**

**HEART FAILURE**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;

- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfuncion or a history of heart failure unless the infection is serious.

**CONTRA-INDICATIONS** Acute porphyrias p. 577

**CAUTIONS** Active liver disease - history of hepatotoxicity with other drugs - susceptibility to congestive heart failure

**INTERACTIONS** Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Abdominal pain - blood pressure changes - cough - diarrhoea - dyspnœa - headache - hepatitis - hypokalaemia - nausea - rash - taste disturbances - vomiting

- **Uncommon** Constipation - dizziness - dyspepsia - flatulence - menstrual disorder - myalgia - oedema - peripheral neuropathy (discontinue treatment)

- **Rare** Alopecia - deafness - erectile dysfunction - heart failure - hypertiglyceridaemia - leucopenia - pancreatitis - photosensitivity - Stevens-Johnson syndrome - tinnitus - toxic epidermal necrolysis - urinary frequency - visual disturbances

- **Frequency not known** Arthralgia - confusion - drowsiness - hepatotoxicity - renal impairment - thrombocytopenia - tremor

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Hyperglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

**PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

**BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

**RENAL IMPAIRMENT** Risk of congestive heart failure.

- With oral use Bioavailability of oral formulations possibly reduced.
